

¹⁵⁰Nd(¹²C,5nγ), ¹²⁴Sn(³⁶S,3nγ) 2002Ha55,2005Pi21

Type	Author	History Citation	Literature Cutoff Date
Full Evaluation	N. Nica	NDS 132, 1 (2016)	4-Dec-2015

Additional information 1.

1982EmZZ: progress report, see 1984Em02 for results.

1984Em02: ²⁵Mg(¹³⁶Xe,4nγ) reaction with E(¹³⁶Xe)=557 MeV. γ measured with Ge and NaI detectors. Level lifetimes deduced by recoil-distance method.

1993Ri05: ¹²⁴Sn(³⁶S,3nγ) at ≈ 158 MeV. Eγ measured with Ge detector array and given for 14 γ's.

2002Ha55: ¹⁵⁰Nd(¹²C,5nγ) at 65 MeV. Measured Eγ, γγ using the GEMINI detector array comprised of 12 BGO

Compton-suppressed HPGe detectors which were at 32°, 58°, 90°, 122°, and 148° with respect to the beam direction.

2005Pi21: ¹²⁴Sn(³⁶S,3nγ) at 165 MeV. Measured Eγ, Iγ, γγ using Gammasphere array of 93 large-volume Compton-suppressed Ge detectors. Also ¹³⁰Te(³⁴S,α3nγ) at 170 MeV. Measured Eγ, Iγ, γγ using Euroball III array of 14 seven-element 'Clusters', 26 four-element 'Clovers' and 30 single-crystal Ge detectors, all detectors were Compton-suppressed. An inner BGO ball was also used. Cranked Nilsson-Strutinsky calculations without pairing done for very high-spin states.

The band structure, backbending, signature splitting, rotational alignments, deformation differences, and shape transitions are discussed in 2005Pi21, 2002Ha55, 2000Ha59, 1994Mu10, 1993Ri05, and 1977Hj01.

¹⁵⁷Dy Levels

Before 2005Pi21 scheme was primarily from 2002Ha55 with levels added above J = 53/2 from 1993Ri05 and level T_{1/2} from 1984Em02. The actual most extensive level scheme is that of 2005Pi21 with eight bands that extended the six bands of 2002Ha55 and added two new bands. All γ-ray and level energies of 2005Pi21 are rounded off to integer values with no uncertainties and no intensities for γ transitions. The level scheme of 2002Ha55 was constructed from coincidence relations, intensity balances, and DCO ratios, however no γ-ray energy uncertainties, intensities or DCO ratios were reported. Because the more precisely reported values, the Eγ data of 2002Ha55 were preferred for the common portion of the level scheme.

[†] For E γ 's from **2002Ha55** from least-squares fit to E γ 's by compilers where they assigned uncertainties to the γ -ray energies of 0.3 and 1 keV (the level energy uncertainties of the compilers have not been adopted here). The rounded off E γ 's from **2005Pi21** were added on top of the highest levels calculated by the least-squares fit giving also rounded off values for the level energies coming exclusively from **2005Pi21** measured E γ 's.

[‡] The energies of the bandheads for the 9/2⁺ and 11/2⁻ bands were determined (**2002Ha55**) from the energies of the depopulating γ 's taken from ^{157}Dy adopted γ radiations.

Assignments are primarily from **2002Ha55**. No measurements to determine J^π values were done by **2005Pi21** which adopted those of **2002Ha55** (also **1993Ri05** and **1973Kl03**) for the common part of the level scheme, while for the new part they assigned J^π values based on band affiliation and theoretical calculations. Altogether all J^π assignments agree with those of the Adopted Levels.

@ From **1984Em02**, unless otherwise noted. **1984Em02** show the 13/2⁺ level at 2388 rather than the 238 keV given here. However, since the γ -ray sequences, here and in **1984Em02**, agree, the T_{1/2} values from **1984Em02** are included.

& 583 γ from 37/2⁻ and 596 γ from 33/2⁻ from **2005Pi21** are adopted here, the order of which is reversed in **2002Ha55**.

^a from **1974An11**.

^b Band(A): $\nu h_{9/2,3/2}[521]$ $\alpha=-1/2$ band.

^c Band(a): $\nu h_{9/2,3/2}[521]$ $\alpha=+1/2$ band.

^d Band(B): $\nu i_{13/2,3/2}[651]$ $\alpha=+1/2$ band.

^e Band(b): $\nu i_{13/2,3/2}[651]$ $\alpha=-1/2$ band.

^f Band(C): $\nu h_{11/2,11/2}[505]$ $\alpha=-1/2$ band.

^g Band(c): $\nu h_{11/2,11/2}[505]$ $\alpha=+1/2$ band.

^h Band(D): Possible 3-quasiparticle band, $\alpha=+1/2$.

ⁱ Band(d): Possible 3-quasiparticle band, $\alpha=-1/2$.
