In <sup>159</sup>Tb(d,3nγ), [1977Dr03](#) report the 4<sup>+</sup> level at 317 keV is populated from an isomer with T<sub>1/2</sub>=16.1 ns +6-4 and the 6<sup>+</sup> level at 637 keV is populated from an isomer with T<sub>1/2</sub> > 250 ns. The energies of these isomeric levels have not been reported.

<sup>†</sup> From 1970Je09, unless otherwise noted. Several  $\gamma$ 's are multiply placed in both 1970Je09 and 1966Gr04.

<sup>‡</sup> Calculated by evaluator from cross section values which are taken to be  $I_\gamma(1+\alpha)$  values for (p,2n $\gamma$ ) reaction at 21 MeV (1970Je09). Uncertainties in the cross sections are 20% for transitions above 100 keV and 30% for 98.9-keV  $\gamma$ .
