

Adopted Levels, Gammas

| Type | Author | History Citation | Literature Cutoff Date |
|-----------------|-------------|---------------------|------------------------|
| Full Evaluation | C. W. Reich | NDS 112,2497 (2011) | 1-Jun-2011 |

Q(β^-)=-3.30×10³ 3; S(n)=7.21×10³ 3; S(p)=6108 18; Q(α)=1798 11 [2012Wa38](#)

Note: Current evaluation has used the following Q record \$ -3310 24 7222 27 6110 18 1794 11 [2009AuZZ](#).

[2003Au03](#) report the following: for Q(β^-), 3310 29; for S(n), 7222 26; for S(p), 6110 18; and, for Q(α), 1794 11.

[Additional information 1](#).

Data are primarily from ¹⁶¹Tm ϵ decay and in-beam studies with additions from (d,t) study and ¹⁶¹Er IT decay (7.5 μ s).

¹⁶¹Er Levels

Calculations of mixing of the wave functions for first few levels of rotational bands are given by [1995Dz02](#). For the levels assigned here, the calculated wave functions are all quite pure (i.e., $\geq 90\%$ the assigned state).

| 26143? [#] | (119/2 ⁻) | A | J ^π : from γ to (115/2 ⁻) level and expected band structure. |

[†] From least-squares fit to γ-ray energies or from (d,t) study for levels below 6100 keV and from reported level energies above 6600 keV.

[‡] J^π and band assignments are based on γ multiplicities from ¹⁶¹Tm ε decay and from γ-ray anisotropy ratios in heavy-ion

Adopted Levels, Gammas (continued)

 ^{161}Er Levels (continued)

recation studies, agreement of experimental and calculated cross sections from (d,t), and expected rotational-band structure in in-beam studies.

Band(A): $3/2[521]$ band, $\alpha=-1/2$. $A=11.96$ keV, $B=-0.4$ eV, $A_3=-8.9$ eV, from energies of the $3/2$, $5/2$, $7/2$, and $9/2$ levels. Strength of E1 transitions to members of the $\pi=+$ band suggests the presence of octupole-correlation effects ([2011Ch12](#), [2011Ch26](#)).

@ Band(a): $3/2[521]$ band, $\alpha=+1/2$. See the comment for the $\alpha=-1/2$ branch.

& Band(B): $5/2[523]$ band. $A=13.07$ keV, $B=+16.7$ eV.

^a Band(C): Coriolis-mixed $+\pi$ band, $\alpha=+1/2$.

^b Band(c): Coriolis-mixed $+\pi$ band, $\alpha=-1/2$.

^c Band(D): $3/2[651]$ bandhead, with $3/2[402]$ mixture.

^d Band(E): $11/2[505]$ band, $\alpha=-1/2$. $A=15.4$ keV, $B=-1.6$ eV, from energies of $11/2$, $13/2$, and $15/2$ levels.

^e Band(e): $11/2[505]$ band, $\alpha=+1/2$.

^f Band(F): $3/2[402]$ band, with $3/2[651]$ mixture. Calculated band parameters are $A=2.1$ and $B=+0.56$, so they are not adopted.

^g Band(G): $1/2[400]$ bandhead.

^h Band(H): $3/2[532]$ bandhead.

ⁱ Band(I): $5/2[512]$ bandhead.

^j Band(J): Possible $K^\pi=9/2^+$ bandhead. Conf is $\pi 7/2[404]+\pi 7/2[523]-\nu 5/2[523]$, from population via a probable allowed-unhindered ε transition from $\pi 7/2[404]$.

[†] In their heavy-ion study, 2011Ch12 place special emphasis on measurement of the E1/E2 branching ratios from selected levels. These are the values listed here. The values obtained from their γ spectrum are also listed for comparison with these specifically measured ones.

[‡] For levels below 400 keV, multiplicarities of the γ rays are from ce data from ¹⁶¹Tm ϵ decay (both 1975Ad08 and 1980Ab18). For levels above 400 keV, multiplicarities are generally from the γ -ray anisotropy-ratio (R_{ADO}) data of 2011Ch12 from a heavy-ion study.

Evaluator's combination of data from ¹⁶¹Tm ϵ decay (1975Ad08,1980Ab18). No uncertainties are given since they cannot be computed from the available data.

@ Total theoretical internal conversion coefficients, calculated using the Brfcc code (2008Ki07) with Frozen orbital approximation based on γ -ray energies, assigned multiplicarities, and mixing ratios, unless otherwise specified.

& Multiply placed with undivided intensity.

^a Multiply placed with intensity suitably divided.

^b Placement of transition in the level scheme is uncertain.
