^{161}Pm produced via projectile fragmentation of a 345 MeV/nucleon ^{238}U beam on a 4-mm thick Be target at the RIBF facility of the RIKEN Nishina Center. Ions of interest were separated and identified on an ion-by-ion basis using the BigRIPS in-flight separator using the ΔE -ToF- $B\rho$ method. Selected fragments were transported through the ZeroDegree spectrometer and implanted into the WAS3ABi Si array or a passive Cu stopper. Measured E_γ , γ , $\gamma\gamma$ coincidence, $\gamma(t)$ using the EURICA array consisting of 12 large-volume Ge cluster detectors.
