2016Jo01 compiled for XUNDL batabase by B. Singh (McMaster).

2016Jo01: E=270 MeV. Target=1.0 mg/cm² thick, 96.5% enriched ¹⁰⁶Cd self-supporting foil. Measured E γ , I γ , $\gamma\gamma$ -coin, $\gamma\gamma(\theta)$ (DCO), recoil implants, (implants) γ -coin. Recoil-decay tagging technique using RITU gas-filled separator and GREAT spectrometer and JUROGAM array at University of Jyvaskyla accelerator laboratory. Deduced high-spin levels, J^π , bands, configurations, alignments. Comparison with predictions of cranked shell-model calculations.

[†] From least-squares fit to E γ values.

[‡] As proposed by 2016Jo01, based on $\gamma\gamma(\theta)$ (DCO) data.

Band(A): Band based on g.s. Configuration= $\nu i_{13/2}^2$ before the band crossing at $\hbar\omega \approx 0.3$ MeV, $\nu i_{13/2}^2 \otimes \nu h_{9/2}^2$ after the crossing.

@ Band(B): Band based on (11⁻). Configuration= $\nu i_{13/2} \otimes \nu(h_{9/2}, f_{7/2})$.

 $\gamma(^{162}\text{W})$

The DCO ratios are for 90° and 158° geometry, with gates on $\Delta J=2$, quadrupole transitions. For a guide, DCO values for known transitions in ¹⁶⁴W were 0.94 9 for 490 γ , 4⁺ \rightarrow 2⁺ transition, and 0.67 14 for 752 γ , 7⁻ \rightarrow 6⁺ transition.

[†] 2016Jo01 assign uncertainty of 0.5 keV for γ rays with $I_\gamma > 10$, up to 2 keV for weaker γ rays. Evaluator assigns 1.0 keV for γ rays with $I_\gamma = 2-10$, and 2.0 keV for $I_\gamma < 2$.

[‡] From DCO value and RUL, assuming level $T_{1/2} < 10$ ns.
