

$^{163}\text{Ho} \varepsilon$ decay (4570 y) 1997Ga12,1994Ya07,1992Ha15

Type	Author	History	Citation	Literature Cutoff Date
Full Evaluation	C. W. Reich, Balraj Singh		NDS 111, 1211 (2010)	12-Apr-2010

Parent: ^{163}Ho : E=0.0; $J^\pi=7/2^-$; $T_{1/2}=4570$ y 25; $Q(\varepsilon)=2.555$ 16; $\% \varepsilon$ decay=100.0

$^{163}\text{Ho}-J^\pi, T_{1/2}, Q(\varepsilon)$: Additional information 1.

Additional information 2.

1997Ga12 (also 1998Me13): measured N1, N2, M1, and M2 resolved x-ray lines with FWHM= 40 eV. Deduced $Q(\varepsilon)$ and electron-neutrino mass limit (< 250 eV).

1994Ya07, 1988Ka20 (also 1986Ya17, 1983Ya11): measured M x ray, deduced $Q(\varepsilon)$, $T_{1/2}$ (by isotope-dilution mass spectrometry), $\log ft$, electron-neutrino mass limit.

1992Ha15, 1985Ha12 (also 1992Ha03, 1985HaZO): measured x rays, deduced $\alpha(M)\exp/\alpha(N)\exp$, $Q(\varepsilon)$, electron-neutrino mass limit.

1987Sp02 (also 1986SpZZ), 1985Sp01, 1983Ba32, 1981Be56: measured $T_{1/2}$, deduced $Q(\varepsilon)$, neutrino mass limit.

1983Jo04 (also 1982An19): measured Auger electrons, x rays, deduced partial decay $T_{1/2}$, $\log ft$, electron-neutrino mass limit.

1968Ho17 (also 1969HoZS): measured $T_{1/2}$, M/L ratio, deduced $Q(\varepsilon)$.

1961Bj02, 1960Na10, 1954Ha19: measured $T_{1/2}$.

Theoretical calculations: 1994Re18, 1993Su01, 1988Ri08, 1985Ri05, 1985Ho25, 1983Ke07, 1983De24 (also 1982De52).

Analysis of ε data: 1985Qi01.

$T_{1/2}$: 4569 y 27 (1988Ka20, 1994Ya07), 4570 y 25 (1983Ba32), 7000 y 2000 (1982An19, 1983Jo04), 33 y 23 (1968Ho17), >500 y (1961Bj02), >1000 y (1960Na10), >20 y (1954Ha19). Weighted average of 1994Ya07 and 1983Ba32: 4570 y 25.

$Q(\varepsilon)$: 2.600 50 and (2.800 50 for mass(neutrino)=0) (1997Ga12), 2.71 10 (original 2.710 +100-5 of 1994Ya07), 2.561 20 (1992Ha15), 2.511-2.572 (original 2.616-2.694 of 1992Ju01 corrected in 2003Wa32), 2.60 3 (1986Ya17) 2.56 5 (original 2.60 3 of 1985Ha12 corrected in 2003Wa32). Value recommended by 2003Au03 and 2009AuZZ: 2.555 16. It should be noted that $Q(\varepsilon)$ and neutrino mass are correlated in the analysis.

Limits on electron neutrino mass: <250 eV (1997Ga12), <460 eV (1994Ya07), <225 eV (at 95% confidence limit) (1987Sp02), <1.3 keV (1982An19). A recent review article (2008Ot03) recommends this limit as <2 eV (95% confidence limit) from analyses of β spectrum of tritium decay.

 ^{163}Dy Levels

E(level)	J^π
0.0	$5/2^-$

 ε radiations

E(decay)	E(level)	Ie^{\dagger}	$\log ft$	Comments
(2.555 16)	0.0	100	4.91 1	$\varepsilon M+=1.00$ Log ft : from a log ft code of R.B. Firestone (LBNL). Others: 4.993 +30-1 (1994Ya07) for $Q(\varepsilon)=2.710+100-5$ and mass(neutrino)= 0.110 keV +350-110; 5.00 +6-1 (from log ft code of Firestone using $Q(\varepsilon)=2.710+100-5$ from 1994Ya07); 5.12 (1983Jo04, from comparison to a similar β transition in ^{161}Ho decay). Additional information 3.

[†] Absolute intensity per 100 decays.
