

$^{142}\text{Nd}(^{27}\text{Al},4\text{n}\gamma)$ **2001Ro01**

Type	Author	History	Citation	Literature Cutoff Date
Full Evaluation	Ashok K. Jain and Anwesha Ghosh, Balraj Singh		NDS 107, 1075 (2006)	15-Apr-2006

2001Ro01: E=150 MeV. Measured $E\gamma$, $I\gamma$, $\gamma\gamma$, $\gamma(q)$, $\gamma\gamma(\theta)$ (DCO), and γ (lin pol) using AFRODITE spectrometer, comprised of eight Compton-suppressed Clover detectors, and seven fourfold segmented LEPS's.

Other:

1991CIZX, **1992Si12**: $^{106}\text{Pd}(^{63}\text{Cu},2\text{p}2\text{n}\gamma)$ E=290 MeV. Measured $E\gamma$, $I\gamma$, $\gamma\gamma$ using TESSA3 array. In **1991CIZX**, four tentative discrete structures were reported, none of which were interconnected. Cascades labeled as 1, 2 and 4 have some similarity with those in **2001Ro01**, whereas those labeled as 3, 5 and 6 are not reported by **2001Ro01**. About 10 γ rays were assigned to ^{165}Ta (energies not quoted) in γ -spectrum figure 1 of **1992Si12** based on a level scheme reported by **1991CIZX**.

 ^{165}Ta Levels

[†] From least-squares fit to $E\gamma$'s.

[‡] As proposed by **2001Ro01**; parentheses have been added by the evaluators since the ground-state J^π is tentative. The same assignments are given in the 'Adopted Levels'.

[#] Band(A): $\pi9/2[514]$, $\alpha=+1/2$. The alignment of the first pair of $i_{13/2}$ neutrons occurs at $\hbar\omega \approx 0.25$ MeV between spins 29/2 and 33/2.

[@] Band(a): $\pi9/2[514]$, $\alpha=-1/2$. The alignment of the first pair of $i_{13/2}$ neutrons occurs at $\hbar\omega \approx 0.25$ MeV between spins 27/2 and 31/2.

 $\gamma(^{165}\text{Ta})$

DCO's are for 45° and 90° and gated on $\Delta J=2$, quadrupole transitions. DCO=0.8 and 1.3 correspond to $\Delta J=1$, dipole and $\Delta J=2$, quadrupole transitions, respectively.

POL=linear polarization coefficient of γ rays, positive for electric transitions and negative for magnetic transitions.

[†] From $\gamma\gamma(\theta)$ (DCO) and/or γ (lin pol). For mult=ΔJ=1, M1 transitions, small E2 admixture cannot be ruled out. The mult=D indicates ΔJ=1 transition.

[‡] 2001Ro01 state that the γ transition belongs to an unidentified sequence In ^{165}Ta .

[#] Doublet. The second component belongs to another unidentified band in ^{165}Ta .

[@] Placement of transition in the level scheme is uncertain.

^x γ ray not placed in level scheme.

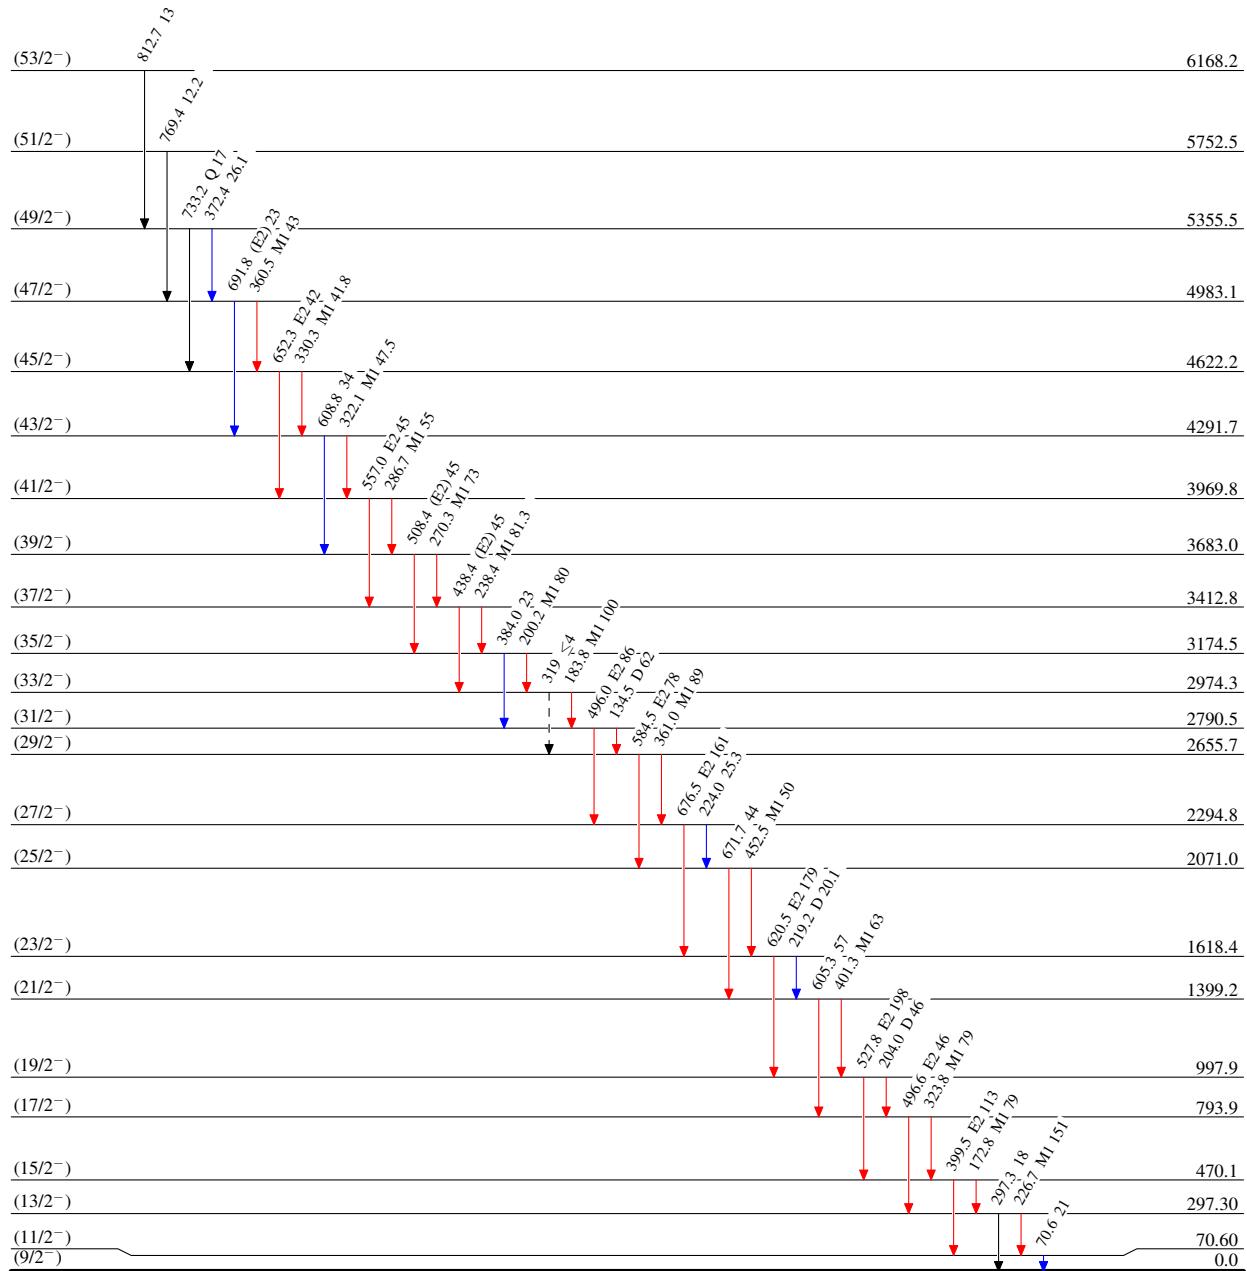

$^{142}\text{Nd}(^{27}\text{Al},4\text{n}\gamma)$ 2001Ro01

Legend

Level Scheme

Intensities: Relative I_γ

- $I_\gamma < 2\% \times I_\gamma^{\max}$
- $I_\gamma < 10\% \times I_\gamma^{\max}$
- $I_\gamma > 10\% \times I_\gamma^{\max}$
- - - - - → γ Decay (Uncertain)
