[†] From (¹¹B,5n γ), except As noted. intraband transitions are assigned $\Delta\pi=(\text{No})$. ΔI_γ ranges between 10% and 50% for (¹¹B,5n γ).

[‡] From $\gamma(\theta)$ In (α ,3n γ), except As noted.

From $\gamma(\theta)$ In (α ,3n γ), assigning $\Delta\pi=(\text{No})$ to intraband transitions, unless $\gamma(\theta)$, combined with $\gamma\gamma$ coin resolving time, definitely eliminates $\Delta\pi=\text{yes}$ based on RUL.

@ From (α ,3n γ).

& Q or (Q) from DCO for intraband transition In (¹¹B,5n γ). $\Delta\pi=(\text{No})$ assigned based on band structure.

^a Total theoretical internal conversion coefficients, calculated using the BrIcc code (2008Ki07) with Frozen orbital approximation based on γ -ray energies, assigned multiplicities, and mixing ratios, unless otherwise specified.

^b Multiply placed with intensity suitably divided.

^c Placement of transition in the level scheme is uncertain.
