[1975Re15](#):  $^{16}\text{O}(^{18}\text{O}, ^{17}\text{O})$ , E=42,52 MeV; measured  $\sigma(E(^{17}\text{O}),\theta)$ ; deduced reaction mechanism.

[2018Li59](#): XUNDL dataset compiled by TUNL, 2019.

An 84 MeV beam of  $^{18}\text{O}$  ions, from the INFN-Catania tandem, impinged on a  $210 \mu\text{g}/\text{cm}^2$   $\text{WO}_3$  foil that was placed at the MAGNEX target position. The  $^{17}\text{O}$  reaction products were momentum analyzed in the MAGNEX spectrometer and identified in the focal plane. Differential cross sections are reported for  $^{17}\text{O}^*(0, 0.87, 3.15, 5.20 \text{ MeV})$  for  $\theta_{\text{c.m.}} \approx 7^\circ$  to  $24^\circ$ .

Spectroscopic amplitudes were deduced via shell model analysis of  $(^{18}\text{O}, ^{17}\text{O})$  reaction data on  $^{28}\text{Si}$  and  $^{64}\text{Ni}$  targets using the NUSHELLX code.

 $^{17}\text{O}$  Levels

E(level)	$J^\pi$	Comments
$0^\dagger$	$5/2^+$	
$0.87 \times 10^3$	$1/2^+$	E(level): The single excitation and mutual $^{16}\text{O}(^{18}\text{O}, ^{17}\text{O}^*(870))^{17}\text{O}^*(870)$ reactions are observed.
$3.15 \times 10^3$	$1/2^-$	
$5.20 \times 10^3$	$3/2^+$	

$^\dagger$  Also populated in ([1975Re15](#)).
