## Decay Scheme

Intensities: Relative  $I_\gamma$

Energy level diagram for the decay of  $^{173}\text{Ir}_{96}$ . The ground state is at 0.0 eV with a lifetime of 22.4 s. An excited state at 91.8 eV decays via  $M_1/E_2$  to the ground state. Another excited state at 141.4 eV decays via  $E_1$  to the ground state. A transition from 91.8 eV to 141.4 eV is labeled >28 ns. The diagram also shows the decay of  $^{173}\text{Os}_{97}$  to  $^{173}\text{Ir}_{96}$  via  $\beta^+$  decay with  $Q_\epsilon = 7370 \text{ SY}$ .
