

^{179}Pt ϵ decay **1993Me13,2000Ro41**

| Type | Author | History Citation | Literature Cutoff Date |
|-----------------|-----------------|---------------------|------------------------|
| Full Evaluation | Coral M. Baglin | NDS 110, 265 (2009) | 15-Nov-2008 |

Parent: ^{179}Pt : $E=0.0$; $J^\pi=1/2^-$; $T_{1/2}=21.2$ s 4; $Q(\epsilon)=5814$ 14; $\% \epsilon + \% \beta^+$ decay=99.76 3

2000Ro41: measured E(ce), I(ce) using high-resolution magnetic spectrograph. source: descendant of ^{183}Hg source.

1993Me13: measured $E\gamma$, $I\gamma$, $\gamma\gamma$ coin, K x ray- γ coin, $\gamma(t)$.

 ^{179}Ir Levels

| E(level) | J^π † | Comments |
|----------|----------------------------|---|
| 0.0‡ | (5/2) ⁻ | |
| 99.8‡ | (1/2) ⁻ | |
| 193.1‡ | (3/2) ⁻ | |
| 271.5 | (1/2,3/2) ⁺ | Possible configuration=(π 3/2[402]) (1993Me13). |
| 343.0 | (1/2,3/2,5/2) ⁻ | |
| 377.8 | | |
| 493.1 | (1/2,3/2,5/2) ⁻ | |
| 502.2 | (1/2,3/2,5/2) ⁻ | |

† From Adopted Levels.

‡ Band(A): possible 1/2[541] band member.

 ϵ, β^+ radiations

Since $Q(\epsilon)$ is large (=5814), and decay is only observed to populate levels with $E \leq 502$ keV, the decay scheme is probably incomplete, and the deduced $\epsilon + \beta^+$ feeding and $\log ft$ values may be unreliable. Also, significant $I\gamma$ remains unplaced.

| E(decay) | E(level) | $I\beta^+$ ‡ | $I\epsilon$ ‡ | $\log ft$ † | $I(\epsilon + \beta^+)$ ‡ | Comments |
|-----------|----------|--------------|---------------|-------------|---------------------------|---|
| (5312 14) | 502.2 | 4.9 8 | 3.7 6 | 5.58 8 | 8.6 14 | av $E\beta=1943.0$ 65; $\epsilon K=0.3531$ 19; $\epsilon L=0.0593$ 4; $\epsilon M+=0.01866$ 10 |
| (5321 14) | 493.1 | 6.8 11 | 5.2 8 | 5.44 7 | 12.0 19 | av $E\beta=1947.2$ 65; $\epsilon K=0.3519$ 19; $\epsilon L=0.0591$ 4; $\epsilon M+=0.01860$ 10 |
| (5436 14) | 377.8 | 1.5 2 | 1.0 2 | 6.16 7 | 2.5 4 | av $E\beta=2000.4$ 65; $\epsilon K=0.3368$ 18; $\epsilon L=0.0565$ 3; $\epsilon M+=0.01779$ 10 |
| (5471 14) | 343.0 | 4.0 8 | 2.7 5 | 5.75 9 | 6.7 13 | av $E\beta=2016.4$ 65; $\epsilon K=0.3324$ 18; $\epsilon L=0.0558$ 3; $\epsilon M+=0.01755$ 10 |
| (5543 14) | 271.5 | 9.4 13 | 6.2 9 | 5.40 7 | 15.6 22 | av $E\beta=2049.5$ 65; $\epsilon K=0.3234$ 18; $\epsilon L=0.0543$ 3; $\epsilon M+=0.01707$ 10 Log ft : far too low for a first-forbidden transition. If the unplaced 1565.4 γ fed this level (consistent with $\gamma\gamma$ coin data), $\log ft$ would increase to a more acceptable value of 5.94 12. |
| (5621 14) | 193.1 | 23 5 | 15 3 | 5.04 10 | 38 8 | av $E\beta=2085.8$ 65; $\epsilon K=0.3139$ 17; $\epsilon L=0.0526$ 3; $\epsilon M+=0.01656$ 9 |
| (5714 14) | 99.8 | 11 9 | 6 5 | 5.4 4 | 17 14 | av $E\beta=2129.0$ 65; $\epsilon K=0.3029$ 17; $\epsilon L=0.0508$ 3; $\epsilon M+=0.01598$ 9 |

† These values probably do not constitute a reliable argument for level J^π because the three unplaced transitions have significant intensity. note that $\log ft=5.0$ and 5.4 , respectively, to the 193 and 272 levels which have opposite parity; this inconsistency could be removed, however, if the 1565.4 γ fed the 272 level. placement of the 203.3 γ and 915.3 γ may significantly change $\log ft$ values to other levels, also.

‡ Absolute intensity per 100 decays.
