$E(^{136}\text{Xe})=622$  MeV. Measured  $E\gamma$ ,  $I\gamma$ ,  $\gamma\gamma$ ,  $\gamma\gamma(t)$  of delayed transitions using the recoil shadow technique with a  $^{208}\text{Pb}$  catcher foil and an array of two Ge(Li) detectors and ten NaI detectors. Delayed transitions were investigated in the 110 ns time window between the 1 ns beam bursts.

[Additional information 1.](#)

 $^{180}\text{Os}$  Levels

$\gamma\gamma(t)$  data showed the existence of two isomeric states feeding the observed levels, one with  $T_{1/2}\approx 130$  ns and  $J\geq 18$  which feeds the states with  $J=10-18$  and another with  $T_{1/2}\approx 20$  ns and  $J\geq 8$  which feeds lower-spin states.

<sup>†</sup> From a least-squares fit to  $E\gamma$  by evaluator.

<sup>‡</sup> From the Adopted Levels.

<sup>#</sup> g.s. band.

 $\gamma(^{180}\text{Os})$ 

All  $\gamma$ 's presented in [1985Pe07](#) are ascribed to the  $T_{1/2}\approx 130$  ns isomer decay. In addition, the  $\gamma$ 's originating from below the 8<sup>+</sup> level of the g.s. band were found to have a  $T_{1/2}\approx 20$  ns component.
