1998Dr09: $^{176}\text{Yb}(^{11}\text{B},\alpha 2n\gamma)$, E=55 MeV; Target: 4.6 mg/cm² of ^{176}Yb enriched to 97%; Detectors: CAESAR detector array with six Compton-suppressed Ge detectors. Measured E γ , I γ , $\gamma\gamma$ and lifetimes.

1998Sa60: $^{176}\text{Yb}(^{11}\text{B},\alpha 2n\gamma)$, E=52, 57 MeV. Detectors: NORDBALL array (at E(^{11}B)=57 MeV) of 18 Compton-suppressed HPGe detectors and two planar Ge detectors, and PEX array (at E(^{11}B)=52 MeV) of four EUROBALL cluster detectors and one clover detector. Measured E γ , I γ , $\gamma\gamma$, and lifetimes.

 ^{181}Ta Levels

The level diagrams from 1998Dr09 and 1998Sa60 agree well in general. The level structure presented here is the combination from both. For the high energy part of the 9/2[514] band, the evaluator has adopted the data from 1998Sa60.

1403.3 ^j 3	(17/2)		E(level): The level at 1403.9 keV deexcites by emitting γ 's of similar energies but very different branching ratios compared with this state; hence identified as two levels by 1998Dr09. T _{1/2} : 3.3 ns for 1403.3 or 1403.9 (1998Dr09).
1403.4 ^{ak} 6	15/2 ⁻		E(level): Level observed in 1998Sa60, deexcites by emitting 861, 1066 and 1244 keV γ 's to the 9/2 ⁻ band, is identified (by the evaluator) as a different state from the levels at 1403 and 1404 keV by 1998Dr09. However, there might be some chance that this level is actually the doublet of 1403.3+1403.9 from 1998Dr09. In this case, one might attribute the level 1403.4+x as the 1472.9 state from 1998Dr09 with x=69.0.
1403.9 ^j 3	(15/2)		See comments on 1403.3.
