

¹⁸⁴Re ε decay (35.4 d) 1974Mc08

| Type | Author | History Citation | Literature Cutoff Date |
|-----------------|-----------------|--------------------|------------------------|
| Full Evaluation | Coral M. Baglin | NDS 111,275 (2010) | 1-Oct-2009 |

Parent: ¹⁸⁴Re: E=0.0; J^π=3⁽⁻⁾; T_{1/2}=35.4 d 7; Q(ε)=1481 4; %ε+%β⁺ decay=100.0

Others: 1960Bo07, 1962B112, 1963Bi04, 1963Dz05, 1963Jo03, 1964Ha06, 1966Ag03, 1966Dz04, 1968Ag01, 1969Gl04, 1969Zu01, 1970Ag06, 1970BIZT, 1970Do08, 1970Ku05, 1971Ta19, 1973Ag03, 1973Ag07, 1973Ca08, 1973Hu06, 1973Kr01, 1974SvZY, 1975Bu01, 1976KI06, 1977Ga21, 1982Al05, 1987Bu26.

The decay scheme is that proposed by 1974Mc08 based on energy sums and γγ-coincidence data.

¹⁸⁴W Levels

| E(level) [†] | J ^π [‡] | T _{1/2} | Comments |

[†] From intensity imbalance At each level.

[‡] Absolute intensity per 100 decays.

[#] Existence of this branch is questionable.

γ(¹⁸⁴W)

I_γ normalization: From Σ (I(γ+ce) to g.s.)=100.

For γγ see [1973Ag03](#), [1974Mc08](#).

For (ce)γ see [1963Dz05](#), [1966Dz04](#).

ce data have been reported by [1966Ag03](#), [1968Ag01](#), [1970Ag06](#), [1973Ag03](#), [1973Ag07](#), [1973Ca08](#), [1974Mc08](#), [1974SvZY](#). Others: [1966Dz04](#), [1964Ha06](#).

Extensive internal conversion coefficient data have been deduced by [1973Ag07](#), [1974Mc08](#), and [1974SvZY](#) based on their relative I(ce) and I(γ) measurements normalized so that α(K)(903γ)=0.00452 (E2 theory).

$\gamma(^{184}\text{W})$ (continued)

† From 1974Mc08, except As noted. Others: 1970Ku05, 1971Ta19, 1973Ag07, 1975Bu01, 1974SvZY, 1988BuZD.

‡ Relative I_γ based on the decay scheme and I_γ from 1974Mc08 measured for a ¹⁸⁴Re ground-state plus metastable-state source in secular equilibrium. The mixed decay can be decomposed to obtain separately the ground-state and metastable-state contributions because 169 d ¹⁸⁴Re ε decay directly populates just one level and that level is not fed in ¹⁸⁴Re(g.s.) ε decay. the evaluator has revised the authors' values taking into account small changes in the theoretical conversion coefficients. Other I_γ : 1970Ku05, 1973Ag07, 1973Ca08, 1974SvZY, 1975Bu01.

Photons unobserved. Limit on I_γ from I(ce(K)) of 1976Kl06 if multipolarity is as indicated.

@ from $\gamma(\theta, H, T)$; weighted average of -16.7 ± 8 (1972Bu35), -18.2 ± 12 (1973Hu06), -16.1 ± 9 (1973Kr01)). Others: 1969Zu01, $-19 \pm 3-5$ (1970Do08), $-22 \pm 6-7$ (1973Ca08; $\gamma\gamma(\theta)$), $-17.6 \pm 15-18$ (1982Al05). Based on $\gamma\text{-}\gamma(\theta)$, ce- $\gamma(\theta)$, 1969Zu01 and 1970Do08 suggest the possibility of E0 admixture and M1 penetration effects. Taking $\delta(E2, M1) = -18 \pm 2$, and $\alpha(K) = 0.0061 \pm 6$, 1969Zu01 obtain $E0/E2 < 0.37$, $-82 < \lambda < +196$. Taking $\delta(E2, M1) = -16.7 \pm 14-12$, and $\alpha(K) = 0.0064 \pm 3$, 1970Do08 obtain $-0.28 < E0/E2 < +0.38$, $-113 < \lambda < +53$. Based on L-subshell ratios, 1972KaYB obtain $E0/E2 < 0.54$, but do not consider penetration effects. In the above, $E0/E2$ is the ratio of conversion electron components, and λ is the M1 penetration parameter.

& For absolute intensity per 100 decays, multiply by 0.421 ± 11 .

^a Total theoretical internal conversion coefficients, calculated using the BrIcc code (2008Ki07) with Frozen orbital approximation based on γ -ray energies, assigned multipolarities, and mixing ratios, unless otherwise specified.

¹⁸⁴Re ε decay (35.4 d) ¹⁹⁷⁴Mc08

Decay Scheme

Legend

- I_γ < 2% × I_{γmax}
- I_γ < 10% × I_{γmax}
- I_γ > 10% × I_{γmax}
