2017Ma39: The ¹⁸⁶Re nuclide was produced in two experiments using the ¹⁸⁶W(d,2n γ) reaction and 6-mg/cm²-thick target enriched to 80% in ¹⁸⁶W. In the first experiment, the 14UD Pelletron accelerator at ANU was used to produce a deuteron beam at energies ranging between 12 and 18 MeV. Gamma-ray singles and γ - γ -t coin measurements at 12.5 and 14.5 MeV were carried out. The CAESAR array comprising of 9 Compton-suppressed HPGe detectors and 2 unsuppressed LEPS detectors were used for these measurements. The second experiment was performed at RCNP at Osaka University using the CAGRA array that consisted of 16 clover-type HPGe detectors. γ - γ -t coincidence measurements at 14.5-MeV beam energy were carried out.
