[‡] 2002An19 searched for crossover α decay from ^{191}Po ($J^\pi=13/2^+$) to the ^{187}Pb ($J^\pi=3/2^-$), but did not find any evidence. An upperlimit of hindrance factor \geq 80 20 is calculated for an expected crossover 7374 α .

[‡] From 2002An19.

[#] From $r_0=1.526$ 22, average of $r_0(^{186}\text{Pb})=1.54$ 2 and $r_0(^{188}\text{Pb})=1.511$ 8 (1998Ak04), $T_{1/2}=93$ ms 3 for 40 15 level of ^{191}Po , $Q(\alpha)(^{191}\text{Po})=7501$ 11, and % α (^{191}Po)=100 from systematics. The calculated hindrance factor here is larger by a factor of ~2.9 than that reported in 2002An19, which is probably arises due to the difference of r_0 value used in this calculation.

[@] For absolute intensity per 100 decays, multiply by 0.96 4.

[&] Existence of this branch is questionable.
