**1978Fl02:** E=15 MeV triton beam was produced from the Los Alamos Scientific Laboratory FN Van de Graaff accelerator. Target was 94.47% enriched  $^{188}\text{Os}$  on a carbon backing. Reaction products were momentum-analyzed with a Q3D magnetic spectrograph (FHMW=10-15 keV). Measured  $\sigma(\theta)$  (12° to 60°). Deduced levels, J, π, L-transfers from DWBA analysis.

**1979Ci05** and **1981Ci01** compare two-neutron transfer strengths for  $0^+$  states with predictions from IBA model. Transition strength to g.s. measured at E(t)=17 MeV.

 $^{190}\text{Os}$  Levels

E(level)	L <sup>†</sup>	dσ/dΩ (μb/sr) <sup>‡</sup>	Comments
0	0	285	
187 5		17	
548 5		24	dσ/dΩ (μb/sr): for doublet 548+558.

<sup>†</sup> From DWBA analysis of  $\sigma(\theta)$  in **1978Fl02**. For other states  $\sigma(\theta)$  data are reported but unique L-values cannot be deduced (**1978Fl02**).

<sup>‡</sup> At 30° (**1978Fl02**).
