$J^\pi(^{189}\text{Os g.s.})=3/2^-$.

1974Ya02: E=12 MeV deuteron beam was produced from the Florida State University Tandem Van de Graaff accelerator. Target was isotopically enriched ^{189}Os with a thickness of $\approx 10\text{-}20 \mu\text{g}/\text{cm}^2$ on a carbon backing. Reaction products were momentum-analyzed with a broad-range magnetic spectrograph (FWHM=15-20 keV). Measured $\sigma(\theta)$ (45° to 108°). Deduced levels See also [1973ThZM](#) (thesis) from the same group.

[†] Energies are defined relative to 186.7 keV level ([1974Ya02](#)).

[‡] Quoted values are from 65° in [1974Ya02](#). Cross sections at 45° , 75° , 80° , and 108° are also given by [1974Ya02](#).

[#] At 45° ([1974Ya02](#)).
