**2010La16:** <sup>190</sup>W ions were produced by E=840 MeV <sup>136</sup>Xe beam from the ATLAS accelerator at ANL, bombarding a 20 mg/cm<sup>2</sup> <sup>192</sup>Os or a 6 mg/cm<sup>2</sup> <sup>186</sup>W target. Measured Eγ, Iγ, γγ, delayed γ spectra using Gammasphere array at ATLAS-ANL facility. In reference 24, authors mentioned that full details of this study are to be published elsewhere. But in evaluators' search of literature, no further publication from this group seems to have appeared.

<sup>†</sup> From Eγ data, assuming ΔEγ=1 keV for each γ ray.

<sup>‡</sup> From 2010La16, based on systematics of even-even nuclei up to 8<sup>+</sup>, and band assignment for higher positive-parity levels. For 10<sup>-</sup> level, the assignment is from (M2) transition to 1742, 8<sup>+</sup> level.

# Band(A): g.s. band.

@ Band(B): K<sup>π</sup>=8<sup>+</sup>, ν9/2[505]⊗ν7/2[503].
