

¹⁹⁸Pt($\alpha,3n\gamma$) 1974Pr09,1978Me11

Type	Author	History Citation	Literature Cutoff Date
Full Evaluation	Balraj Singh	NDS 108, 79 (2007)	15-Oct-2006

1974Pr09: E=37 MeV. Target 60% enriched, assignments based upon $\gamma\gamma$ coin, $\gamma(\theta)$ At two angles, I γ .
 1978Me11: E=31 to 57 MeV. Measured E γ , I γ , $\gamma\gamma$, ce, Ce(t) with orange spectrometer.

¹⁹⁹Hg Levels

The two bands described here follow qualitatively the predictions of the rotation-aligned coupling scheme. These results indicate oblate deformation, so that the spherical lead region and the prolate deformed rare-earth region are connected by a transitional region of oblate deformation. See also 1974Pr09 for details.

E(level) [†]	J π [‡]	T _{1/2}	Comments
0.0	1/2 ⁻		
158.4	5/2 ⁻		
532.5 [#]	13/2 ⁺	42.67 min 9	T _{1/2} : from 'Adopted Levels'. Additional information 1.
823.9 [#] 2	(17/2 ⁺)		E(level): 832.9 In 1974Pr09 is a misprint.
1274.1 ^{&} 2	(15/2 ⁺)		
1357.2 [#] 3	(21/2 ⁺)		
1769.3 ^{&} 3	(19/2 ⁺)		E(level): level from 1974Pr09 only; 1778.1 is a misprint.
2107.3 [#] 4	(25/2 ⁺)		
2332.0 [@] 4	(21/2 ⁻)		
2425.6 [@] 4	(23/2 ⁻)		
2487.8 [@] 4	(25/2 ⁻)		
2629.8 [@] 4	(27/2 ⁻)		
2765.9 [@] 5	(29/2 ⁻)		
3068.5 [@] 4	(31/2 ⁻)		

[†] From least-squares fit to E γ 's, relative to the energy of the 532.5 level (from 'Adopted Levels') held As fixed In the fitting procedure.
[‡] From 'Adopted Levels' for first three levels, from proposed band structures for higher levels (same assignments given in 'Adopted Levels').
[#] Band(A): decoupled band built on $\nu_{i13/2}$. Oblate deformation is expected in rotation-alignment model (1974Pr09). Search (by 1978Me11) for the 29/2⁺ member of this band was unsuccessful. For E γ <1 MeV, I γ (29/2 to 25/2) is <5. This supports the idea that the g.s. bands in even-even Hg change their character from configuration= $\pi h_{11/2}^{-2}$ for A \leq 196 to configuration= $\nu_{i13/2}^{-2}$ for A \geq 198, thus changing the blocking pattern in the neighboring odd-A Hg.
[@] Band(B): $\nu_{i13/2}^{-1} \otimes (5^-, 7^-, 9^- \dots ^{198}\text{Hg core})$ (?).
[&] Band(C): unfavored band built on $\nu_{i13/2}$.

$\gamma(^{199}\text{Hg})$

1068.6 2	11 2	2425.6	(23/2 ⁻)	1357.2	(21/2 ⁺)	(D)			$\gamma\gamma$ coin with 278 γ , 291 γ , 381 γ , 402 γ , 533 γ and 750 γ (1978Me11). Placement (by 1974Pr09) from a 2484 level to 1357 is not supported by $\gamma\gamma$ coin data of 1978Me11.
^x 1127.2 4	3.2 7					D+Q			A ₂ =-0.77 20 (1974Pr09).

† From $\gamma(\theta)$ of 1974Pr09 and ce data of 1978Me11. Since $\gamma(\theta)$ data alone are insensitive to parity determination, the evaluator has assigned mult=Q to $\Delta J=2$ transitions indicated by positive A₂ (1974Pr09 assign E2), and mult=D or D+Q to $\Delta J=1$ transitions indicated by negative A₂ (1974Pr09 assign E1 or M1+E2 to such transitions).

‡ From 1978Me11 at E(α)=35 MeV. Values are also available at 31 and 39 MeV from 1978Me11; and at 37 MeV from 1974Pr09.

Average of 1974Pr09 and 1978Me11.

@ Not observed in coin because of delay at 13/2⁺ level, rounded energy from 'Adopted Gammas'.

& γ from 1974Pr09 only.

^a γ from 1978Me11 only.

^b Total theoretical internal conversion coefficients, calculated using the BrIcc code (2008Ki07) with Frozen orbital approximation based on γ -ray energies, assigned multiplicities, and mixing ratios, unless otherwise specified.

$^{198}\text{Pt}(\alpha,3n\gamma)$ **1974Pr09,1978Me11** (continued)

$\gamma(^{199}\text{Hg})$ (continued)

^c Placement of transition in the level scheme is uncertain.

^x γ ray not placed in level scheme.
