1986Ka07: E(p)=14.5 MeV; Target: ^{203}Tl 87% enriched, metallic, 1-6 mg/cm²; ce measured with up to 5 mm thick Si(Li) detector in a lens spectrometer. Ratios between ce(K)'s of E0 transitions to g.s. and E2 transitions to the 960.7 keV, 2⁺ state were measured.

[†] From ce data in [1986Ka07](#).

[‡] γ-ray was observed in [1986Ka07](#), but the energy was not given. E_γ was deduced from the level scheme given in [1986Ka07](#).

Total theoretical internal conversion coefficients, calculated using the BrIcc code ([2008Ki07](#)) with Frozen orbital approximation based on γ-ray energies, assigned multipolarities, and mixing ratios, unless otherwise specified.
