Parent: ^{207}Rn : E=899.1 10; $J^\pi=13/2^+$; $T_{1/2}=184.5 \mu\text{s}$ 9; %IT decay=100.0

2006Ha17: Produced using $^{164}\text{Dy}(^{48}\text{Ca},5n)$ reaction. Evaporation residues were transported by the VASSILISSA separator and implanted into a DSSD of GABRIELA setup surrounded by seven HPGE detectors. Measured: $E\gamma$, $I\gamma$, ce, $T_{1/2}$.

1974Re06: Produced using $^{197}\text{Au}(^{14}\text{N},4n)$ reaction and also by bombardment of natural Hg targets with ^{12}C ions. $E(^{14}\text{N})=70\text{-}120$ MeV, pulsed beam with 2 ms beam-on and 98 ms beam-off periods. Detectors: several Ge(Li) detectors varying in size from 8 to 40 cm^2 . Measured: $E\gamma$, $I\gamma$, $T_{1/2}$, and γ -K x ray coin.

K x ray=77% 7 (**1974Re06**).

Mult.: Anisotropy of 20% 15 was measured for 665.1 γ (1974Re06), thus suggesting mult=Q. The balance of the level scheme requires mult.=E2. |
