

²⁰⁷Pb(¹⁸O,2 α 2n γ) **2012De11**

Type	Author	History Citation	Literature Cutoff Date
Full Evaluation		NDS 114, 2023 (2013)	23-Sep-2013

Includes population of a high-spin isomer through fragmentation of ²³⁸U beam at 1 GeV/nucleon (2012BoZU,2013Bo18).

2012De11: E(¹⁸O)=93 MeV from INFN, Legnaro facility. Measured E γ , I γ , $\gamma\gamma$ -, $\alpha\gamma$ -, (x ray) γ -coin, $\gamma(\theta)$ using GASP-ISIS spectrometer. Target=2 mg/cm² thick backed by a 25 μ g/cm² carbon foil. Gamma rays were detected by GASP array of 40 Compton-suppressed Ge detectors and multiplicity filter of 80 BGO detectors. The alpha particles from reaction channel were detected by ISIS telescopic array of 40 Δ E-E Si detectors. A total of 350,000 $\gamma\gamma\alpha$ coincidence events were recorded, about 33% of which belonged to 2 α 2n channel leading to levels in ²¹⁵Rn, others to 2 α 1n channel leading to levels in ²¹⁶Rn. Deduced high-spin levels, J, π in ²¹⁵Rn.

2013Bo18, 2012BoZU: ⁹Be(²³⁸U,X), E=1 GeV/nucleon; measured E γ , I γ , half-life of a high-spin isomer by $\gamma(t)$ method.

²¹⁵Rn Levels

E(level) [†]	J π [‡]	T _{1/2}	Comments
0.0 [#]	9/2 ⁺		
316.5 [@] 2	11/2 ⁺		
570.1 [#] 2	13/2 ⁺		
946.3 [@] 2	15/2 ⁺		
1016.5 [#] 2	17/2 ⁺		
1334.3 [@] 2	19/2 ⁺		
1403.8 [#] 3	21/2 ⁺		
1607.8 [@] 3	23/2 ⁺		
1731.1 [#] 3	(25/2) ⁺		
1804.8 [@] 4	27/2 ⁺		
1804.8+x		57 ns +21-12	%IT=100 T _{1/2} : from $\gamma(t)$ in ⁹ Be(²³⁸ U,X), E=1 GeV/nucleon reaction (2013Bo18,2012BoZU). E(level): may correspond to 1804.8, 27/2 ⁺ level, but from available data in 2013Bo18 and 2012BoZU location of the isomer remains uncertain. Three γ rays of 287, 392 and 656 keV of similar intensities are reported in 2012BoZU, which may be related to the decay of this isomer.
2287.1 [@] 4	(29/2 ⁺)		
y			Additional information 1.
383.5+y 2			
542.2+y 3			

[†] From least-squares fit to E γ data.

[‡] As assigned by 2012De11 based on multipolarity assignments, band structures, and systematics of similar bands in ²¹³Rn, ²¹⁷Rn and ²¹⁹Th. In Adopted Levels, most of these assignments are given in parentheses since strong arguments are lacking.

[#] Band(A): Band built on $\nu g_{9/2}^3$.

[@] Band(B): Band built on $\nu g_{9/2}^2 \otimes \nu i_{11/2}^1$.

$\gamma(^{215}\text{Rn})$

R(θ)=angular anisotropy ratio for a set of detectors at 31.7°, 36.0°, 144.0° and 148.3° and the other set at 90° relative to the incident beam direction. Expected ratio is 1 for $\Delta J=2$, quadrupole (or stretched quadrupole) and 0.57 for $\Delta J=1$, dipole (or stretched dipole). No gating transitions were used for these measurements.

[†] Dipole or quadrupole from angular anisotropy ratios; electric or magnetic character from total intensity balance.

[‡] This γ ray belongs to ^{215}Rn but is not included in the present level scheme.

[#] Contaminated line. Intensity deduced from coincidence spectra.

[@] The γ ray reported by 2012BoZU in $^9\text{Be}(^{238}\text{U},\text{X})$, E=1 GeV/nucleon reaction, and in coincidence with known transitions in ^{215}Rn from the work of 2012De11, but not placed in level scheme. 2012BoZU state that intensities of 287, 392 and 656 γ rays are similar.

$\&$ Total theoretical internal conversion coefficients, calculated using the BrIcc code (2008Ki07) with Frozen orbital approximation based on γ -ray energies, assigned multipolarities, and mixing ratios, unless otherwise specified.

^x γ ray not placed in level scheme.
