

**$^{229}\text{Pa}$   $\alpha$  decay (1.50 d)    1987Ah05, 1973Ag01, 1958Hi78**

Type	Author	Citation	History Literature Cutoff Date
Full Evaluation	Balraj Singh	ENSDF	25-Oct-2019

Parent:  $^{229}\text{Pa}$ : E=0.0;  $J^\pi=(5/2^+)$ ;  $T_{1/2}=1.50$  d 5;  $Q(\alpha)=5835$  4;  $\% \alpha$  decay=0.48 5

$^{229}\text{Pa}-J^\pi$ : From  $^{229}\text{Pa}$  Adopted Levels in the ENSDF database, as of June 2008), with proposed configuration= $\pi 5/2[642]$ .

$^{229}\text{Pa}-T_{1/2}$ : From  $^{229}\text{Pa}$  Adopted Levels in the ENSDF database, where the value is adopted from the measurement by [1987Ah05](#).

A recent measurement by [2018Gr09](#) reports  $T_{1/2}=1.55$  d 1 (weighted average of the following eight values deduced from decay curves for 117.2- and 119.0-keV  $\gamma$  rays at four different proton bombarding energies: 1.83 d 5, 1.49 d 2, 2.08 d 6, 1.60 d 2, 1.66 d 5, 1.47 d 2, 1.78 d 10, 1.43 d 3). Evaluator's analysis of this result: eight values from [2018Gr09](#) form a discrepant dataset, as regular weighted average gives 1.55 d 5 (not an uncertainty of 0.01 d as given in [2018Gr09](#)), but reduced  $\chi^2$  of 24 is very large in comparison to critical  $\chi^2=2.1$  at 95% confidence level. Weighted average by the method of limitation of relative statistical weights (LRSW) method gives 1.53 d 5, but still with reduced  $\chi^2=14$ , and rejecting the 2.08 d 6 value as an outlier. Weighted average by Normalized Residuals method (NRM), which adjusts uncertainties in data points considered as outliers, gives 1.50 d 3, with reduced  $\chi^2=5$ , still too large to be acceptable. It would seem that unweighted average, which gives a value of 1.67 d 8 is perhaps an appropriate way to deal with this dataset. Based on above problematic issues with these data, reported  $T_{1/2}$  from [2018Gr09](#) is omitted in the adopted half-life of  $^{229}\text{Pa}$  decay.

$^{229}\text{Pa}-Q(\alpha)$ : From [2017Wa10](#).

$^{229}\text{Pa}-\% \alpha$  decay:  $\% \alpha=0.48$  5 for  $^{229}\text{Pa}$   $\alpha$  decay (from  $^{229}\text{Pa}$  Adopted Levels in the ENSDF database, as of June 2008).

[1987Ah05](#): measured  $E_\gamma$ ,  $I_\gamma$ ,  $E(x\text{ ray})$ ,  $I(x\text{ ray})$ , ce,  $\gamma\gamma$ -coin,  $\alpha\gamma$ -coin.

[1973Ag01](#): measured  $E\alpha$ ,  $E\gamma$ ,  $I\gamma$ (in  $\alpha\gamma$ -coin mode),  $\alpha\gamma$ -coin.

[1963Su10](#) (thesis): measured  $E\alpha$ ,  $I\alpha$ ,  $E\gamma$ ,  $\alpha\gamma$ -coin.

[1958Hi78](#) (thesis): measured  $E\alpha$ ,  $I\alpha$ .

<sup>†</sup> From 1987Ah05 unless otherwise stated. Other measurements: 1973Ag01, 1963Su10, 1958Hi78.

<sup>‡</sup> Absolute intensities per 100  $\alpha$  decays, measured by 1987Ah05. Intensities from  $\alpha\gamma$ -coincidences are given by 1973Ag01.

<sup>#</sup> Multipolarities in square brackets assumed from  $\Delta J^\pi$ .

<sup>@</sup> Transition not seen but shown in level-scheme Fig. 4 of 1973Ag01 without any explanation. This transition is not included in the Adopted dataset.

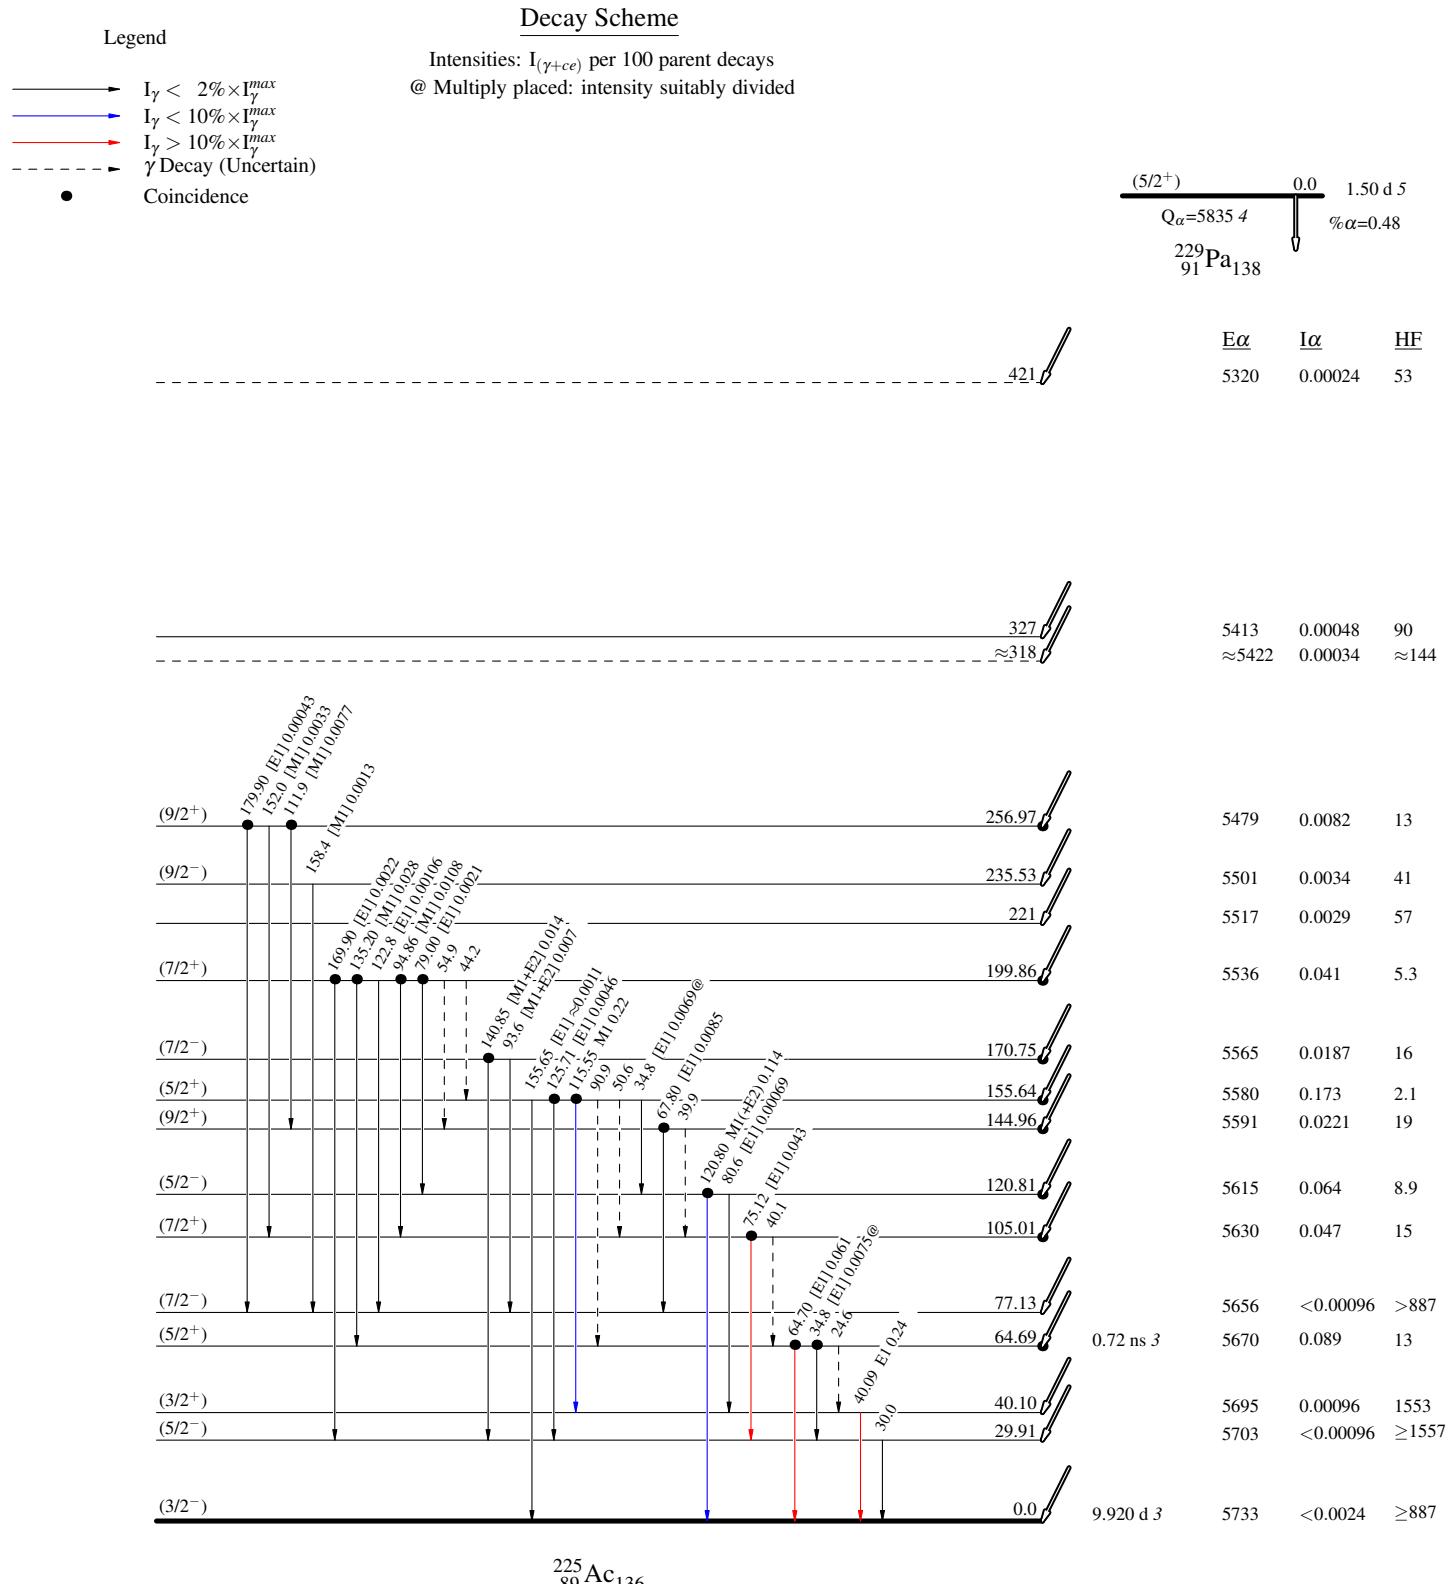

<sup>&</sup> For  $\delta=0.5$  5 in analogy with the mixing ratio for 120.80 $\gamma$ .

<sup>a</sup> For absolute intensity per 100 decays, multiply by 0.0048 5.

<sup>b</sup> Total theoretical internal conversion coefficients, calculated using the BrIcc code (2008Ki07) with Frozen orbital approximation based on  $\gamma$ -ray energies, assigned multipolarities, and mixing ratios, unless otherwise specified.

<sup>c</sup> Multiply placed with intensity suitably divided.

<sup>d</sup> Placement of transition in the level scheme is uncertain.

$^{229}\text{Pa } \alpha$  decay (1.50 d) 1987Ah05,1973Ag01,1958Hi78
