2003Bu12: E=20 MeV. Measured $E\alpha$, $\sigma(E,\theta)$ using an Enge split-pole magnetic spectrograph and a position-sensitive Si detector in the focal plane of the spectrograph. DWBA analysis.

 ^{227}Ac Levels (continued)

† Level energies are averages from the spectra taken at angle 6° , 15° , 25° and 35° with photographic plates and are measured relative to the known energy of 210.8-keV level.

‡ Given as composite configurations where levels are unresolved.

The (p,α) population of this level can be attributed to $\pi 1/2[400]$ (or $\Delta N=2$) admixture in the $\pi 1/2[660]$ band. The $\Delta N=2$ matrix element is estimated as ≈ 80 keV.

@ Cross section values are at 6° , with an additional uncertainty of $\leq 20\%$ in absolute normalization.
