Parent: ²²⁷Ac: E=0.0; J^π=3/2⁻; T_{1/2}=21.772 y 3; Q(β⁻)=44.8 8; %β⁻ decay=98.6200 36

1955Be20: measured β⁻ spectrum using 4π proportional counter.

1959No41: measured β⁻ spectrum, Ece, Ice using scintillation counter with a thin CsI(Tl) crystal for β⁻s and a magnetic spectrograph and scintillation counter with stilbene crystal for conversion electrons.

1995Li04: measured E_γ, I_γ using intrinsic Ge detector with Be window and Ece, Ice, β⁻ spectrum, β_γ coincidences using Si(Li) detector placed inside a magnetic lens.

1997Mu08: ²²⁷Ac activity from decay of ²²⁷Fr and ²²⁷Ra produced at the ISOLDE facility in CERN. Measured Ece, Ice ce-α coincidences using an iron-free magnetic spectrometer and silicon detector; deduced mult and δ for 24.5-keV transition.
