<sup>†</sup> Weighted average of measurements in <sup>228</sup>Ac and <sup>228</sup>Pa decays, unless otherwise noted.

<sup>‡</sup> From <sup>228</sup>Ac  $\beta^-$  decay and/or <sup>228</sup>Pa  $\epsilon$  decay.

#  $\gamma$ -ray not reported in <sup>228</sup>Ac  $\beta^-$  decay.

@ From <sup>228</sup>Pa  $\epsilon$  decay.

& From <sup>232</sup>U  $\alpha$  decay.

<sup>a</sup> From <sup>228</sup>Ac  $\beta^-$  decay.

<sup>b</sup> From ( $\alpha,2n\gamma$ ) data set.

<sup>c</sup> Energy fit poor. Not included in E(level) calculation.

<sup>d</sup> Doublet, energy not included in E(level) calculation.

<sup>e</sup> A  $\gamma$  of this energy was seen in <sup>228</sup>Pa decay and placed here in level scheme; however, the  $\gamma$ 's deexciting the final level of this  $\gamma$  were not seen in <sup>228</sup>Pa decay.

<sup>f</sup>  $\gamma$ 's of approximately same energy and intensity seen in both <sup>228</sup>Ac and <sup>228</sup>Pa decays. On the basis of coin with 911 $\gamma$ , it is suggested in <sup>228</sup>Ac decay, that the  $\gamma$  feeds the 2<sup>+</sup> 968.968 level. In <sup>228</sup>Pa decay, the  $\gamma$  is placed feeding the 3<sup>-</sup> 968.368 level. The energy fit is much better feeding the 3<sup>-</sup> level. Possibly the  $\gamma$  seen is a doublet feeding both the 968 and 969 levels. I $\gamma$ (doublet)=24 6, E(doublet)=674.65 5.

<sup>g</sup> There is a disagreement in the ratio I $\gamma$ (583 $\gamma$ )/I $\gamma$ (651 $\gamma$ ) between <sup>228</sup>Ac decay (1.23 15) and <sup>228</sup>Pa decay (2.26 24).

- <sup>h</sup> Total theoretical internal conversion coefficients, calculated using the BrIcc code (2008Ki07) with Frozen orbital approximation based on  $\gamma$ -ray energies, assigned multipolarities, and mixing ratios, unless otherwise specified.
- <sup>i</sup> Multiply placed with undivided intensity.
- <sup>j</sup> Multiply placed with intensity suitably divided.
- <sup>k</sup> Placement of transition in the level scheme is uncertain.
