

$^{22}\text{Na}({}^3\text{He},\text{d})$ **1995Sc36**

Type	Author	History	Citation	Literature Cutoff Date
Full Evaluation	M. S. Basunia [#] , A. Chakraborty ^{##}		NDS 171, 1 (2021)	1-Jun-2020

 $J^\pi(^{22}\text{Na})=3^+$.Target: 0.7 mCi ^{22}Na target was prepared at ISOLDE, CERN, implanting ^{22}Na ions on a carbon foil (thickness $75 \mu\text{g}/\text{cm}^2$);

Projectile: ${}^3\text{He}$ beam, $E=30$ MeV; Q3D spectrograph, deuteron spectra were obtained with a position-sensitive detection array (a sequence of several proportional wire chambers with cathod readouts), energy resolution of about $\Delta E \sim 1.5$ keV, depending on reaction kinematics, the ejectiles were finally stopped in a scintillation detector. Deuteron and other particles were separated with $\Delta E-E$ arrangement. Measured deuteron spectra, angular distribution of deuteron groups at angles $\theta(\text{lab}=7.5^\circ \text{ to } 31^\circ)$, deduced spectroscopic factors. FWHM 15 keV.

 ^{23}Mg Levels

[†] From [1995Sc36](#). Absolute uncertainty stated to be about 8 keV. The relative uncertainty was 2 keV.

[‡] From comparison of experimental angular distribution with DWBA calculations.

[#] Values for l=2 listed in the column and for l=0, 1, 3 in the comments section. In some cases, [1995Sc36](#) list an upperlimit without a defination for l=0 values. Those values are not listed in the dataset.
