 $J^\pi(^{21}\text{Ne})=3/2^+$.

Target: Enriched (86.5%) ^{21}Ne in a rotating gas cell with Mylar window (thickness $522 \mu\text{g}/\text{cm}^2$); Projectile: ^7Li , $E=18.0 \text{ MeV}$; outgoing α particles were momentum analyzed in a multiangle spectrograph and detected in nuclear emulsion plates. Absorber foil stopped all particles except protons. Deduced excitation energy and differential cross section. DWBA calculations. FWHM $\sim 42 \text{ keV}$.
