 $^{235}\text{U}(^{58}\text{Ni}, ^{59}\text{Ni} \gamma)$  E=325 MeV: 1987Wu03, 1991He19. $^{235}\text{U}(^{206}\text{Pb}, ^{207}\text{Pb} \gamma)$  E=1394 MeV: 1991He19.

Triple-coincidence data are reported in 1987Wu03 and 1991He19.  $\gamma$  rays were detected in coincidence with scattered particles and recoiling  $^{235}\text{U}$  nuclei using 14 germanium detectors located at various angles. The spectra were corrected for Doppler shift.

<sup>†</sup>  $\gamma$ -ray peaks in 1987Wu03 and 1991He19 are identified by the spins of the levels that they connect. E $\gamma$  for energies <200 keV are from Adopted Gammas; E $\gamma$  for energies >200 keV are (except where noted) from K. G. Helmer, an author in 1991He19.

<sup>‡</sup> From "Adopted Gammas".

<sup>#</sup> Placement of transition in the level scheme is uncertain.
