Other: [1943Ma12](#).

2001Ho12: $^{23}\text{Na}(\text{n},\gamma)$ reaction at the range neutron beam energies of 10 – 80 keV was used. The pulsed neutron beams were produced from the the $^7\text{Li}(\text{p},\text{n})^7\text{Be}$ reaction. The sample used was a metallic disk of ^{23}Na with a diameter of 90 mm and thickness of 10 mm. The de-excited gamma rays were detected with a large anti-Compton shielded HPGe spectrometer employing the TOF method. Measured $E\gamma$, $I\gamma$. Dduced the features of 53 and 35 keV resonance states.

(6992.3 3)	E(level): 35 keV neutron capture state. The derived value of the radiative width of the 35 keV resonance is 0.85 eV <i>14</i> in 2001Ho12 . J^π : 2 ⁻ assignment is made in 2001Ho12 .

[†] From 2001Ho12. 2001Ho12 reports gamma transitions decaying from the 53 and 35 keV resonance states and the other low-lying levels. However, the gamma transitions decaying from the 53 keV resonance state are not reported by the evaluators in the present data set. The same have been incorporated separately in the $^{23}\text{Na}(\text{n},\gamma)$ E=53 keV data set.

[‡] The values are to be multiplied by 10^6 (2001Ho12). Not clear presented intensities are relative or other type.

[#] Multiply placed with intensity suitably divided.

[@] Placement of transition in the level scheme is uncertain.
