

^{242}U β^- decay 1979Ha26

Type	Author	History	Citation	Literature Cutoff Date
Full Evaluation	M. J. Martin, C. D. Nesaraja		NDS 186, 261 (2022)	31-Dec-2021

Parent: ^{242}U : E=0.0; $J^\pi=0^+$; $T_{1/2}=16.8$ min 5; $Q(\beta^-)=1200$ SY; % β^- decay=100.0

^{242}U -Q(β^-): 1200 280 ([2021Wa16](#)).

The level scheme is given as constructed by [1979Ha26](#) from $E\gamma$ and $I\gamma$ considerations only. Coincidence data were not taken because of insufficient source intensity. Since conversion electron data were not taken, low-energy highly converted transitions, if any, would not have been seen. The level scheme is tentative.

 ^{242}Np Levels

E(level)	J^π [†]	$T_{1/2}$
0.0	(1 ⁺)	2.2 min 2
55.58 6	(1 ⁻ ,0 ⁻)	
67.60 5	(1 ⁻ ,0 ⁻)	
293.83 8		
329.72 9	(1,0)	
598.26 15	(1,0)	
640.54 8	(1 ⁺ ,0 ⁺)	

[†] From Adopted Levels.

 β^- radiations

$I\beta'$'s are deduced from intensity balance at each level. Because of the possibility of missing highly converted transitions and because of the tentative nature of the decay scheme, the β transitions and their intensities are also tentative.

E(decay)	E(level)	$I\beta^-$ [†]	Log ft	Comments
(559 SY)	640.54	3.6 11	6.0 10	av $E\beta=166$ 97
(601 SY)	598.26	0.53 21	6.9 9	av $E\beta=180$ 98
(870 SY)	329.72	0.8 3	7.3 6	av $E\beta=2.7\times10^2$ 11
(906 SY)	293.83	<0.5	>7.5	av $E\beta=2.9\times10^2$ 11
(1132 SY)	67.60	10 4	6.6 5	av $E\beta=3.7\times10^2$ 11
(1144 SY)	55.58	3.8 12	7.0 5	av $E\beta=3.7\times10^2$ 11
(1200 SY)	0.0	81 6	5.7 4	av $E\beta=4.0\times10^2$ 11
				$I\beta^-$: From $100 - \sum(I(\gamma+ce))$ to the g.s.).
				Existence of this branch is deduced by 1979Ha26 from the fact that the sum of the absolute γ intensities amounts to about 30% of the total energy.
				Logft of 5.7 is consistent with a β transition from the $\nu7/2[624]$ to the $\pi5/2[642]$ Nilsson state.

[†] Absolute intensity per 100 decays.

 $\gamma(^{242}\text{Np})$

$I\gamma$ normalization: the absolute γ intensities were obtained by normalizing the relative $I\gamma$'s to $I(735.9\gamma)=4.9$ 15 per 100 β^- decays of 2.2-min ^{242}Np . The ^{242}U source was in equilibrium with ^{242}Np ,

[†] Additional information 1.[‡] From 1979Ha26.

Relative photon intensities (1979Ha26).

@ The γ 's are assumed to be dipole or E2. Further, the 55.58 and 67.60 γ 's must be E1 or else the total intensity of these transitions would be greater than 100%.

& For absolute intensity per 100 decays, multiply by 0.049 15.

^x γ ray not placed in level scheme.
