Parent:  $^{246}\text{Pu}$ : E=0.0;  $J^\pi=0^+$ ;  $T_{1/2}=10.84$  d 2;  $Q(\beta^-)=401$  syst; % $\beta^-$  decay=100

$^{246}\text{Pu}$ -Q( $\beta^-$ ): 401 14 (2021Wa16)(syst,2021Wa16).

1971Mu05:  $^{246}\text{Pu}$  was obtained from fused cavity debris underground explosion and subsequently was chemically separated. The decay was measured using several Ge(Li) detectors along with the Livermore Compton-suppression system. Measured  $E\gamma$ ,  $I\gamma$ .

1956Ho23:  $^{246}\text{Pu}$  was chemical separated. Measured  $\gamma$ ,  $\gamma\gamma$ -coin, with two NaI(Tl) detectors and  $\beta\gamma$ - coin with one NaI(Tl) and a trans-stilbene crystal detector. Measured  $T_{1/2}$  from decay curve. Deduced  $E\beta$  from Fermi plots.

Others: 1991Po17,1965St10,1956Sm85 (same group as 1956Ho23).
