

$^{248}\text{Cm}(\alpha,\text{t}),(^3\text{He},\text{d})$ 1975Er01

Type	Author	History Citation	Literature Cutoff Date
Full Evaluation	C. D. Nesaraja	NDS 195,718 (2024)	12-Oct-2023

1975Er01:

$^{248}\text{Cm}(\alpha,\text{t})$: 29 MeV beams of α particles from the University of Minnesota MP tandem Van de Graaff accelerator were used to bombard ^{248}Cm targets. The reaction products were studied with an Enge split-pole magnetic spectrograph. Absolute cross sections were determined using two silicon monitor detectors. Cross sections were measured at 80° with the energy resolution width for the spectra between 18-25 keV. Theoretical calculation performed using the DWBA DWUCK code to deduce spectroscopic factor.

$^{248}\text{Cm}(^3\text{He},\text{d})$: 29 MeV beams of ^3He particles from the University of Minnesota MP tandem Van de Graaff accelerator were used to bombard ^{248}Cm targets. The reaction products were studied with an Enge split-pole magnetic spectrograph. Absolute cross sections were determined using two silicon monitor detectors. Cross sections were measured at 60° with the energy resolution width for the spectra between 18-25 keV. Theoretical calculation performed using the DWBA DWUCK code to deduce spectroscopic factor.

[†] From **1975Er01**. The J^π and band assignments are based on cross-sections and $(\alpha,t)/(^3\text{He},d)$ cross-section ratios which are sensitive for determining the angular momentum of levels populated. Previous assignments based on decay studies were also considered.

[‡] Band(A): 3/2[521].

[#] Band(B): 7/2[633].

[@] Band(C): 1/2[400].

[&] Band(D): 5/2[642].

^a Band(E): 5/2[523].

^b Band(F): 7/2[514].

^c Band(G): 9/2[624].

^d Consistent with low L transfer; possible $K^\pi=1/2^-$ band.
