

²⁴⁹Cf(²⁰⁸Pb,²⁰⁸Pb'γ) **2014Ho16**

Type	Author	History Citation	Literature Cutoff Date
Full Evaluation	C. D. Nesaraja	NDS 195,718 (2024)	12-Oct-2023

Includes ²⁴⁹Cf(²⁰⁷Pb,²⁰⁷Pbγ).

2014Ho16: ²⁰⁷Pb beam at energy of ≈15% above the Coulomb barrier from ATLAS accelerator at ANL was scattered off ²⁴⁹Cf.

The target was sandwiched between layers of ¹⁹⁷Au, 150 μg/cm² in front and 50 mg/cm² in the back. The γ-rays were detected using the Gammasphere array with 100 Compton-suppressed Ge detectors. Measured E_γ, γγ, (x ray)γ coin and γγγ. Deduced high-spin levels, J^π, bands, alignment plots, configurations, (g_K-g_R)/Q₀ ratios. Comparisons were made with Woods-Saxon Cranked shell model calculations.

2010Ta22: Single-neutron transfer experiment was carried out at the ATLAS facility of Argonne National Laboratory. A target of ²⁴⁹Cf of 200 μg/cm² was bombarded with ²⁰⁹Bi beam at energy of 1430 MeV. The target was backed on a 50 mg/cm² Au substrate and covered with a 200 μg/cm² Au foil. x-ray and γ coincidences along with cross coincidence with the 569 and 319 keV transition in ²⁰⁷Pb and ²¹⁰Bi allowed unambiguous band assignments. The γ-rays were detected using the Gammasphere array with 100 Compton-suppressed Ge detectors. Measured E_γ, I_γ, γγ, (x ray)γ coin and γγγ. E_γ>180 keV are from email reply on 14 May, 2021 to the evaluator from first author (S. Tandel) in **2010Ta22**. E_γ<181 keV were not observed by **2010Ta22**.
