2009He23: E=219 MeV; measured E γ , I γ , $\gamma\gamma$, ce, (recoil)ce coin and half-lives using the JUROGAM gamma-ray spectrometer coupled to the RITU gas filled separator and GREAT focal-plane detection system at the accelerator laboratory of the University of Jyvaskyla.

2007Lo11: E=242 MeV. Measured two isomers in ²⁵³No from (evaporation residues)(γ and ce) coincidence measurements. The ⁴⁸Ca beam was provided by the U400 cyclotron of the FLNR, JINR, Dubna facility. The evaporation residues were separated by VASSILISSA separator and implanted into the GABRIELA detection system. The γ were detected by seven Ge detectors. Measured E γ , I γ , x rays, ce and half-lives of the isomers by timing correlations between the evaporation residues and γ rays and conversion electrons.

2005Re14: E=219 MeV. Measured E γ , I γ , $\gamma\gamma$, fragment- γ coin with Gammasphere and the fragment mass analyzer.

2003KhZY: Measured γ with Gammasphere and the fragment mass analyzer.

[†] Unresolved multiplet.

[‡] Total theoretical internal conversion coefficients, calculated using the BrIcc code (2008Ki07) with Frozen orbital approximation based on γ -ray energies, assigned multiplicities, and mixing ratios, unless otherwise specified.

[#] Placement of transition in the level scheme is uncertain.
