$^{31}\text{Ar}$  was obtained from 1 GeV protons bombardment on a CaO target at the ISOLDE-PSB facility at CERN; Four detectors (an HPGe, an annular, and two particle telescopes of one  $\Delta E$ -E Si and other gas-E) were used for detecting the decay of  $^{31}\text{Ar}$  and its daughters; Measured proton energy and intensity; summed proton energies. Additional unassigned 2p intensity=5.1%.
