1973Be26: E=18 MeV ^3He beam produced from the University of Pennsylvania tandem Van de Graaff accelerator. A target of pure argon gas enriched to 99.8% in ^{36}Ar . Reaction α -particles detected in Ilford K-1 nuclear emulsions after being momentum-analyzed in a multi-angle spectrograph. Measured $\sigma(E_\alpha, \theta)$. Deduced levels, J^π , L, spectroscopic factors from the DWBA analysis.

 ^{35}Ar Levels

Target ^{36}Ar $J^\pi=0^+$.

Spectroscopic factor C^2S : $N*C^2S/(2*j+1) = \sigma(\theta)^{\text{exp}}/\sigma(\theta)^{\text{DWBA}}$, where j is the total angular momentum of transferred nucleon, $C^2=1/2$ for this reaction and $N=16.8$ deduced in **1973Be26**.

[†] From **1973Be26**.

[‡] Probable doublet (**1973Be26**).

From the comparison of the DWBA predictions with experimental data.
