**1968Jo04:** E=27.5 MeV proton beam produced from the University of Colorado Nuclear Physics Laboratory 1.3 m FFAG cyclotron. Target: gas targets of natural argon (99.6%) and enriched  $^{36}\text{Ar}$  (99%). Detectors: a telescope of a 0.228 mm transmission surface barrier detector and a 0.37 cm lithium-drifted stopping counter, FWHM=120 keV. Measured  $\sigma(E_d,\theta)$ . Deduced levels, L, spectroscopic factors.

**1968Ko11:** E=33.6 MeV proton beam of 1 to 100 nA produced from the Michigan State University sector-focusing cyclotron. Target: a gas target of isotropically enriched  $^{36}\text{Ar}$  (>99%). Detectors: a  $\Delta E$ -E telescope of a 279  $\mu$  silicon surface barrier detector and a 3 mm lithium-drifted silicon counter, FWHM=130 keV; a CsI(Tl) as a monitor throughout the work. Measured  $\sigma(E_d,\theta)$ . Deduced levels,  $J^\pi$ , L, spectroscopic factors.

 $^{35}\text{Ar}$  Levels

Target  $^{36}\text{AR}$   $J^\pi=0^+$ , giving final  $J^\pi=L+1/2$  or  $L-1/2$ .

Spectroscopic factor  $C^2S$ :  $N^*C^2S=\sigma(\theta)^{\text{exp}}/\sigma(\theta)^{\text{DWBA}}$ , where  $N=1.65*3/2$  in [1968Jo04](#).
