1975Fl08, 1973Ca13: E=20 MeV triton beam was produced from the Los Alamos three-stage Van de Graaff. Target was 99.5% enriched ^{36}Ar gas. Reaction products were momentum-analyzed with a broad-range magnetic spectrograph ($\text{FWHM} \approx 35 \text{ keV}$) and detected in nuclear emulsions. Measured $\sigma(E(p),\theta)$. Deduced levels, J, π , L-transfers from DWBA analysis. Comparisons with available data.

1979Fo17: E=15 MeV; measured $\sigma(E(p),\theta)$ for ground state.

All data are from **1975Fl08**, unless otherwise noted.
