1977Ad03: E=100-750 MeV bremsstrahlung beam was produced from the 1.2 GeV Lund electron synchrotron. Target was metallic calcium of natural isotopic composition with a thickness of 1.5 g/cm². De-excitation γ rays were detected with a 35 cm³ Ge(Li) detector. Measured E_γ , yields. Deduced upper limit for C²S value.

 ^{39}Ca Levels

E(level)	J^π [†]	$\sigma_p(\text{eq.q.})$ [‡]	Comments
0	3/2 ⁺		
2470	1/2 ⁺	1.2 2	C ² S≤1.3 nucleons (1977Ad03).
2790	7/2 ⁻	0.2 1	
3020	3/2 ⁻	1.1 4	

[†] From Adopted Levels.

[‡] Quoted values are for cross section per equivalent quantum. 1977Ad03 claim that the pion contribution to the yields are small and of the same order of magnitude as or less than the statistical uncertainty.

 $\gamma(^{39}\text{Ca})$
