Type	Author	History Citation	Literature Cutoff Date
Full Evaluation	Jun Chen	NDS 149, 1 (2018)	1-Jan-2018

Also includes  $^{38}\text{Ar}(p,p)$  and  $^{38}\text{Ar}(p,p'\gamma)$ .

**1984Ha27:** E=0.7-2.4 MeV proton beams were produced from the Helsinki University 2.5-MV Van de Graaff accelerator. Targets were prepared 2.4 and 17  $\mu\text{g}/\text{cm}^2$  dose of  $^{38}\text{Ar}$  ions at 20 and 60 keV, respectively, into 0.4 mm thick Ta sheets.  $\gamma$  rays were detected with a Ge(Li) detector (FWHM=3 keV at 2.6 MeV) and a NaI(Tl) detector. Measured  $E\gamma$ ,  $I\gamma$ ,  $\gamma$  yields. Deduced levels, J,  $\pi$ , resonance strengths,  $\gamma$ -ray branching ratios. Comparisons with available data. Implications of astrophysical nuclear reaction rates of  $^{38}\text{Ar}(p,\gamma)$ .

**1986Zi02:** E=1.39-1.98 MeV protons were produced from the Utrecht 3-MV Van de Graaff accelerator. Targets were argon gas.  $\gamma$  rays were detected with three Ge(Li) detectors and a large-angle Compton-suppression spectrometer (LACSS) consisting of a Ge detector placed in a NaI Compton suppression shield. Measured  $E\gamma$ ,  $I\gamma$ ,  $\gamma(\theta)$ ,  $\gamma$  yields, Doppler-shift attenuation. Deduced levels, J,  $\pi$ , lifetimes,  $\gamma$ -ray branching ratios, multipolarities and mixing ratios. Comparisons with available data and shell-model calculations. Decay schemes of 16 resonances.

**1970Ma31:** E=1.25-2.35 MeV proton beams were produced from the Utrecht 3-MV Van de Graaff accelerator. Target was argon gas (25% in  $^{38}\text{Ar}$ ).  $\gamma$  rays were detected with a NaI crystal and a Ge(Li) detector. Measured  $E\gamma$ ,  $I\gamma$ ,  $\gamma$  yields,  $\gamma(\theta)$ , Doppler-shift attenuation (DSA). Deduced levels, J,  $\pi$ , lifetimes, resonance strengths,  $\gamma$ -ray branching ratios, multipolarities and mixing ratios. Comparisons with available data and shell-model calculations.

Others:

**2008Ka10:** E=0.8-2.8 MeV; measured  $E\gamma$ ,  $I\gamma$ ; deduced total MDR strength functions.

**1974Ke10:** (p, $\gamma$ ), (p,p) E=1390, 1398 keV; measured  $E\gamma$ ,  $I\gamma$ ,  $\gamma(\theta)$ . Deduced widths, J,  $\pi$ ,  $\gamma$  branchings for 7740 level.

**1970An19:** E=1.393 MeV; measured  $E\gamma$ ,  $I\gamma$ , lifetimes by DSAM.

**1966Sk02:** (p,p' $\gamma$ ): resonances.

**1964Ar12:** E=0.900-1.400 MeV; measured  $E\gamma$ ,  $I\gamma$ ,  $\gamma(\theta)$  for 8 resonances.

$I_\gamma$ : combined for 4742 $\gamma$ +3887 $\gamma$ .

<sup>†</sup> From level-energy differences, unless otherwise noted. Secondary gammas are given for only a few levels.

<sup>‡</sup> From **1984Ha27**, unless otherwise stated. It is stated in **1984Ha27** that the uncertainties in the intensities range from 5% for strong transitions to about 40% for very weak ones; it is from 10% to 50% in **1970Ma31**.

<sup>#</sup> From  $\gamma(\theta)$  data of **1986Zi02**, unless otherwise stated.

@ From **1986Zi02**.

& Placement of transition in the level scheme is uncertain.
