
$^{40}\text{Ar}(\text{p},\text{p}'),(\text{pol p},\text{p}')$ 1988Bi04, 1985De03, 1961Ka26

Type	Author	History	
		Citation	Literature Cutoff Date
Full Evaluation	Jun Chen	NDS 140, 1 (2017)	30-Sep-2015

Includes (p,p), (pol p,p).

1988Bi04: (p,p') E=0.8 GeV proton beams was produced from the Los Alamos Clinton P. Anderson Meson Physics Facility (LAMPF). Target was natural argon gas. Scattered ions were analyzed with the high-resolution spectrometer (HRS) (FWHM=140 keV). Measured $\sigma(\theta)$. Deduced levels, J, π , L-transfer, deformation parameters from DWBA analysis.

1985De03: (p,p') E=29.6, 35.1 MeV proton beams were produced from the Milan AVF cyclotron. Target was gaseous argon. Scattered particles were detected with three telescopes of surface-barrier silicon detectors (FWHM=80-120 keV). Measured $\sigma(\theta)$. Deduced levels, J, π , L-transfer, deformation parameters, transition strengths from coupled-channel analysis and DWBA analysis.

1961Ka26: (p,p') E=8 MeV. 23 levels reported with precise energies.

1968Jo14: (p,p') E=24.85 MeV. Measured $\sigma(\theta)$. Deduced levels, J, π , deformation parameters from DWBA analysis.

1965Gr11: (p,p') E=14.1, 16.9 MeV. Measured $\sigma(\theta)$. Deduced levels, J, π , deformation parameters from DWBA analysis.

1961Be32: (p,p') E=7.3, 9.4 MeV. 21 levels reported.

Others.

2007Ok01: (p,p') E=25.1, 32.5, 40.7 MeV. Measured $\sigma(\theta)$, analyzing powers.

1992Go18: (p,p) E=1.875-1.879 MeV. Measured yield.

1983Ba01: (p,p') E=1 GeV. Measured total σ .

1983Ok01: (pol p,p) E=25.1, 32.5, 40.7 MeV. Measured analyzing powers.

1982Sa19, 1982Sa37, 1979Sa38, 1978Sa33: (pol p,p) E=65 MeV. Measured analyzing powers.

1980Fa06, 1980Fa07: (p,p) E=20.9-44.1 MeV. Measured $\sigma(\theta)$.

1977Bi09: (p,p) E=1.093, 0.992 MeV. Measured σ .

1973Be41: (pol p,p) E=40 MeV. Measured analyzing powers.

1971Ru04: (pol p,p') E=49.4 MeV. Measured $\sigma(\theta)$, analyzing powers. 5 levels at 1460, 2530, 2910, 3230 and 3710 studied.

1969Ba23: (pol p,p) E=21 MeV. Measured $\sigma(\theta)$, analyzing powers.

1966Hu05, 1966Hu12: (p,p') E=4.1, 7.3 MeV. Measured $\sigma(\theta)$.

1964Bo27: (pol p,p) E=14.5 MeV. Measured $\sigma(\theta)$.

1962Ta05: (p,p') E=6.14 MeV. Measured $\sigma(\theta)$ for three levels.

1962An04: (p,p') E=14.8 MeV.

1961Ba29: (p,p') E=0.8-3.5 MeV. Measured $\sigma(\theta)$.

1961Ro13, 1961Ro05: (pol p,p) E=8, 10 MeV. Measured $\sigma(\theta)$.

1961Co29: (p,p) E=1-2 MeV.

1960Od01: (p,p') E=7.6-14.2 MeV. Measured $\sigma(\theta)$ for gs and 1460 peak. Two other peaks seen at 3700 and 4800.

1958Ty47: (p,p') E=185 MeV. Measured $\sigma(\theta)$.

1957Gi14: (p,p') E=9.5 MeV.

1956Ei15: (p,p') E=8.5, 9.0, 9.8 MeV. Measured $\sigma(\theta)$.

1956Va28: (p,p').

1956Bu95: (p,p) E=9.5 MeV.

1956Ki54: (p,p) E=14.5, 20, 31.5 MeV. Measured $\sigma(\theta)$.

1954Fr43: (p,p') E=9.5 MeV. Measured $\sigma(\theta)$.

1947He02: (p,p') E=9.2 MeV, levels reported at 1500 and 2400.

Additional information 1.

^{40}Ar Levels

B(EL) values from **1985De03** correspond to different nuclear models (rotational or vibrational) and to different choice of low-lying levels in coupled-channel (CC) calculations. Known γ -ray branching ratios and lifetimes were used in the analysis. The negative sign for some of these values is that of the corresponding matrix element. See full details in **1985De03**.

Multiple values of deformation parameters and transition probabilities B(EL) arise from choice of different nuclear models and to selection of low-lying levels used in the analysis.
