
 $^{39}\text{K}(\text{n},\gamma),(\text{pol n},\gamma)$ E=thermal 1984Vo01,2013Fi01,1972Op01

Type	Author	History Citation	Literature Cutoff Date
Full Evaluation	Jun Chen	NDS 140, 1 (2017)	30-Sep-2015

1984Vo01: (n, γ) Thermal neutrons were produced from the high-flux reactor of the Institut Laue-Langevin at Grenoble. Targets were 36 mg ^{nat}KCl in wrapped in Al or 190 mg and 62 mg ^{nat}KF in a graphite container. γ rays were detected with the ILL curved-crystal spectrometers GAMS, a large-volume Ge(Li) detector and a pair spectrometer. Measured $E\gamma$, $I\gamma$. Deduced levels. A total of 427 γ rays were reported out of which 302 were placed amongst 63 levels, with 38 γ rays doubly or multiply assigned.

2013Fi01: (n, γ) Thermal neutrons were provided by the 10-MW Budapest Reactor. Target was a 0.02 g stoichiometric, high purity KCl. γ rays were detected with a Compton-suppressed HPGe detector. Measured $E\gamma$, total radiative neutron σ . Deduced levels, J, π , feedings. Monte Carlo simulations using computer code DICEBOX. Comparison with statistical model calculations, previous studies, and ENSDF evaluations. A total of 320 γ rays were reported out of which 291 γ rays were associated with 83 levels.

1972Op01: (n, γ) thermal neutrons were produced from the high-flux reactor at Petten, Netherlands. Targets were 400 mg natural K_2CO_3 or 400 mg 98.3% enriched K_2Co_3 . γ rays were detected with two Ge(Li) detectors (FWHM=3.0 and 2.6 keV at 1.33 MeV). Measured $E\gamma$, $I\gamma$, $\gamma\gamma$ -coin. Deduced levels. A total of 222 γ rays were reported out of which 187 γ rays were associated with 56 levels. $\gamma\gamma$ -coin data involved about 25 transitions.

1970Jo04: (n, γ) thermal neutrons were produced from the McMaster reactor. Target was a 35 g sample of natural potassium metal sealed in a quartz tube. γ rays were detected with Ge(Li) detectors. Measured $E\gamma$, $I\gamma$, $\gamma\gamma$ -coin. Deduced levels. A total of 252 γ rays were reported out of which 202 γ rays were associated with 56 levels. $\gamma\gamma$ -coin data involved 62 transitions.

2002Va28: (n, γ). Measured $\gamma\gamma$ -coin, two-quantum cascades. A total of 70 intermediate levels were found from 96 cascades.

Others:

2003MoZU, 2002Re13: Compilations.

2001Ac04: (n, γ). Measured $E\gamma$, $I\gamma$. Deduced k_0 factor.

1988Se06: (n, γ). Measured $\gamma\gamma(\theta)$.

1974Op01, 1972Op02, 1969Ab03: (pol n, γ). Measured γ (circ pol) of capture γ rays to nine levels. Deduced interference in capture state.

1974IsZX: (n, γ). Measured $E\gamma$, $I\gamma$.

1972Se19: (n, γ). Measured relative intensities for six secondary γ rays and nine primary γ rays.

1972GoZN, 1971GoYN: (n, γ). Measured $E\gamma$, $I\gamma$, $\gamma\gamma$ -coin, $\gamma\gamma(\theta)$. Deduced levels, J, π , Q.

1970Ei03: (pol n, γ). Measured γ (circ pol) of capture γ rays to 30-keV level.

1969Bo04: (n, γ). Measured $\gamma\gamma(t)$ for 30-keV level.

1966Ke07: (n, γ). Measured $E\gamma$, $I\gamma$.

1965Ru06: (n, γ). Measured $E\gamma$, $I\gamma$.

1956Br42, 1956Ad49, 1952Ki32: (n, γ). Measured $E\gamma$, $I\gamma$.

The γ -ray placements and the resulting level scheme is primarily from **1984Vo01**, which is mostly based on earlier (n, γ) studies of **1972Op01** and **1970Jo04** combined with other reaction studies. However, based on a better $E\gamma$ precision achieved in the work of **1984Vo01**, placements for several γ rays are different than proposed by **1970Jo04** and/or **1972Op01**. Based on consistency with level energies, intensity balance through the level scheme and spin-parity considerations, **2013Fi01** have resolved many multiple placements of γ rays by **1984Vo01**, and have also placed many unplaced γ rays in **1984Vo01**. New levels are proposed by **2013Fi01** based on these new placements as well as new γ -ray transitions observed in their work.

 ^{40}K Levels

The following levels reported by **1972Op01** and/or **1970Jo04** have been omitted since they have not been confirmed in the high-resolution work of **1984Vo01** and **2013Fi01** (either the γ rays decaying from these levels were not observed or were placed differently based on better precision in **1984Vo01** and **2013Fi01**): 4586.8, 4665.8 from **1972Op01**; 2457.5, 2557.9, 2978.6, 3378.3, 3875.0, 4273.3, 4579.6 from **1970Jo04**; 2947.5, 3711.1, 3902.1, 4908.5 from **1972Op01** and **1970Jo04**.

(7799.553 14)	1 ^{+,2⁺}	E(level): S(n)=7799.62 6 (2012Wa38). J^π : s-wave capture in ^{39}K (g.s. $J^\pi=3/2^+$). From $\gamma\gamma(\theta)$, an incoherent superposition of 1 ⁺ and 2 ⁺ is allowed, while from γ (circ pol), superposition is coherent, with either constructive or destructive interference.

[†] From a least-squares fit to γ -ray energies, unless otherwise noted. Doubly or multiply placed γ rays were not used in the least-squares procedure. Uncertainties of some γ rays were increased by a factor 2 or 4 in the fitting procedure in order to get an acceptable fit ($\chi^2 < 3$).

[‡] Levels proposed by 2013Fi01.

[#] From Adopted Levels, unless otherwise noted.

^a Based on γ (circ pol) in 1974Op01 and $\gamma\gamma(\theta)$ in 1988Se06.

& Based on γ (circ pol) in 1974Op01 and arguments in Adopted Levels.

^a From 2002Va28 based on two-quantum cascades. These levels are not included in the Adopted Levels due to insufficient information about decay modes and J^π values.

$^{39}\text{K}(\text{n},\gamma),(\text{pol n},\gamma)$ E=thermal 1984Vo01,2013Fi01,1972Op01 (continued) $\gamma(^{40}\text{K})$

I γ normalization: normalized assuming $\Sigma(I\gamma \text{ to g.s.})=100$ (1984Vo01). However, observed deexcitation intensity from the capture state is 89% of g.s. feeding.

$\sigma_n=2.1$ 2 (1981MuZQ), 2.19 3 (2003MoZU). 2013Fi01 measured a total cross section of 2.252 b 16 observed feeding the GS and the 30-keV levels and they also deduce $\sigma=2.28$ b 4 or 2.35 b 15 using two different approaches that both combine measured data and simulations based on statistical model accounting for unobserved statistical GS feeding.

The following γ rays reported by 1972Op01 and/or 1970Jo04 have been omitted since they are not confirmed in the high-resolution work of 1984Vo01 and 2013Fi01: 246.9, 380.2, 1582.9, 1674.1, 2102.1, 2294.9, 3120.5, 3447.0, 4299.9, 4452.6, 4769.5, 4908.6, 5495.9 and 5840.9 from 1972Op01; 243.6, 284.6, 291.5, 297.5, 300.3, 368.3, 387.1, 421.6, 432.6, 475.9, 485.3, 608.6, 701.8, 720.7, 734.6, 1008.3, 1139.1, 1410.6, 1468.5, 1583.6, 1646.0, 1659.0, 1675.8, 1747.8, 2105.2, 2136.6, 2304.1, 2620.2, 2860.3, 2978.6, 3473.3, 3767.6, 3794.4, 3829.1, 4122.3, 4239.7, 4638.3, 4770.4, 5133.7, 5341.5, 5366.5, 5461.3, and 5841.8 from 1970Jo04.

$\gamma\gamma$ -coin information is from 1970Jo04 as shown by 1984Vo01.

[†] From 1984Vo01, unless otherwise noted. Values reported in 2013Fi01 are in a good agreement with the quoted values here but with less precision. Extensive E $_\gamma$

³⁹K(n, γ),(pol n, γ) E=thermal 1984Vo01,2013Fi01,1972Op01 (continued) γ (⁴⁰K) (continued)

and I γ data are also available from 1972Op01 1970Jo04, but are much less precise, thus not considered here.

[#] From 1984Vo01, unless otherwise noted. To convert relative I γ values in 1984Vo01 to cross section values, multiply by 0.0235 3, which is obtained by 2013Fi01 from a least-squares fit to their cross-section values versus the corresponding relative I γ values in 1984Vo01. Cross-section values from 2013Fi01 are given under comments.

[#] Based on γ (circ pol) in 1974Op01, unless otherwise noted.

[@] Uncertainties were increased by a factor of 2 in the least-squares fit, except for 554.741 γ , 1213.53 γ , 1393.16 γ , 1466.11 γ , 1820.35 γ , and 2539.87 γ , increased by a factor of 4. Poor fit for 554.741 γ with the fitted energy deviates by about 5 times the quoted energy uncertainty.

[&] From $\gamma\gamma$ -coin data of 2002Va28.

^a Observed and placed in 2013Fi01, not observed in 1984Vo01. Relative intensities are deduced by evaluator by dividing cross-section values in 2013Fi01 by 0.0235 3.

^b Placed by 2013Fi01, unplaced in 1984Vo01.

^c Placed by 2013Fi01, placed differently in 1984Vo01.

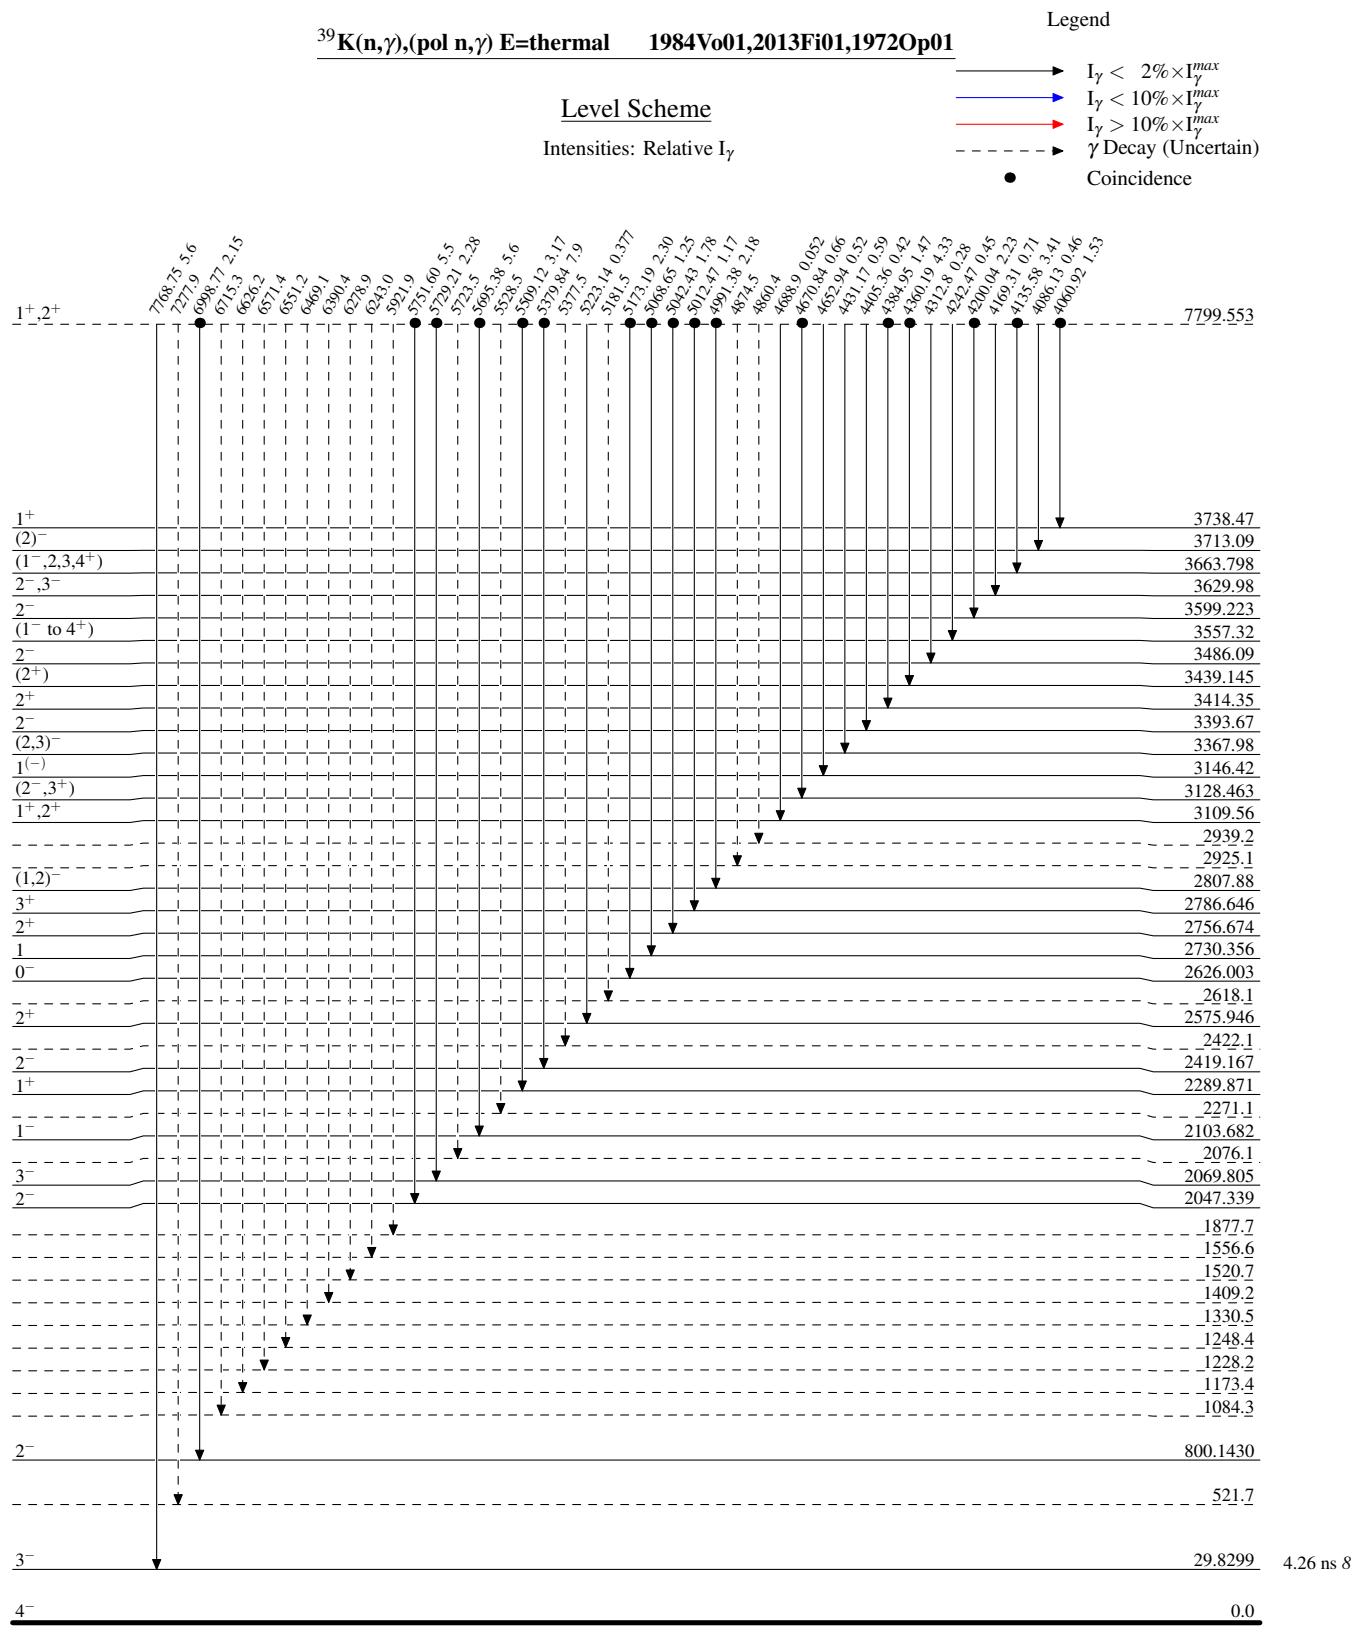

^d From $\gamma\gamma(\theta)$ in 1988Se06.

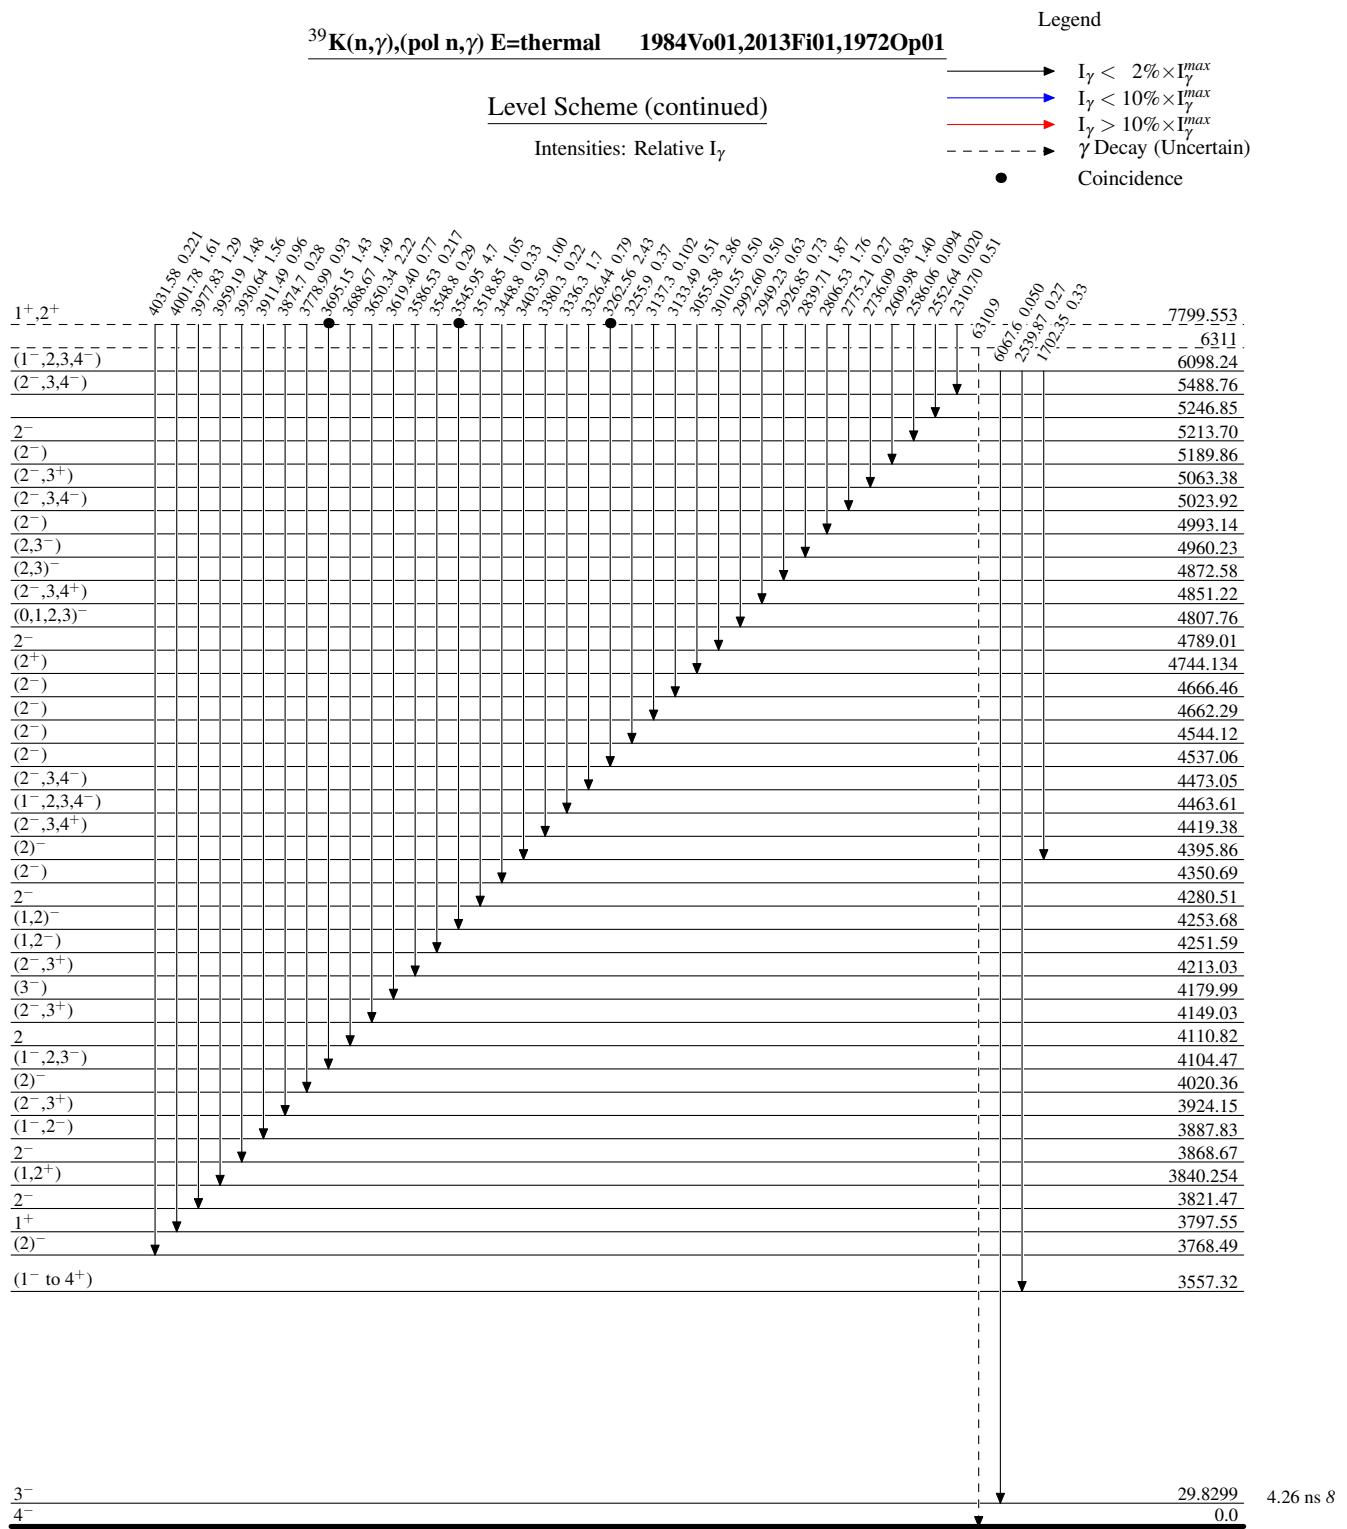

^e Intensity per 100 neutron captures.

^f Multiply placed with undivided intensity.

^g Placement of transition in the level scheme is uncertain.

^x γ ray not placed in level scheme.
