1976Do05: E(d)=52 MeV. Measured $\sigma(\theta)$ for $\theta=8^\circ$ to 30° using counter telescopes consisting of ΔE and E surface barrier detectors (FWHM=120 keV); DWBA analysis.

1969Yn01: E(d)=21.4 MeV. Measured $\sigma(\theta)$ for $\theta=12^\circ$ to 30° using magnetic analysis and ΔE -E telescope of surface-barrier detectors (FWHM=70-130 keV); DWBA analysis.

[†] From [1976Do05](#). Level energies for 6 groups from [1969Yn01](#) are included in the comments.

[‡] From DWBA calculations.

[#] From fitting experimental data in the forward maximum with $\sigma_{\text{exp}} = NC^2S\sigma_{\text{DWBA}}$ with N=2.95. In the DWBA calculations, the following orbitals were assumed: 2s_{1/2} for L=0, 2p_{3/2} for L=1, 1d_{5/2} for L=2 except for the ground state where 1d_{3/2} was assumed, and 1f_{7/2} for L=3.

[@] [1978En02](#) quote S values for first six groups, adjusted upwards by $\approx 35\%$ based on standardized normalization factors as in [1977En02](#). Higher levels are considered by [1978En02](#) as unresolved structures.
