^{44}Ca(pol γ,γ'),(γ,γ') 2011Is01

History

Type	Author	Citation	Literature Cutoff Date
Full Evaluation	Jun Chen, Balraj Singh and John A. Cameron	NDS 112, 2357 (2011)	31-Jul-2011

2011Is01: Two experiments: the first one performed at the Darmstadt High Intensity Photon Setup (DHIPS) with the E=6.3 and 9.9 MeV polarized photons produced via bremsstrahlung by stopping completely the intense electron beam from the injector of the electron accelerator S-DALINAC in a thick copper radiator. HPGe detectors at 90° and 130° for detecting γ-rays with BGO Compton-surpression shields. Targets of 97.1% enriched CaO_3; the second performed at the High Intensity γ-ray Source (HIγS) facility at Duke University with the polarized photon beam produced via intercavity laser Compton backscattering (LCB) of a free-electron laser (FEL) beam with relativistic electrons in a storage ring. Four HPGe clover detectors for detecting γ-rays. Target of 95.8 enriched CaO_3. Measured Eγ, Iγ, γ polarization asymmetry. Deduced levels, J, π, γ-widths, transition strengths.

1986Be30: E=4-7 MeV γ-rays produced by the V(n,γ) reaction. Target of 4.86 g/cm^2 natural Ca. A 40 cm^3 Ge(Li) detector for detecting scattered γ-rays. Measured Eγ, Iγ, $\gamma(\theta)$, γ(pol). Deduced levels, J^π, widths, γ-branchings, mixing ratio.

2004Ha51: E=9.9 MeV γ-rays source produced at the nuclear resonance fluorescence (NRF) setup at the Darmstadt superconducting electron linear accelerator S-DALINAC. Measured Eγ, Iγ. Deduced electric dipole strength distribution, pygmy dipole resonance features.

Other: 2007Kl05.

All data above 3301 keV level (except 5210 keV level) is from 2011Is01; others including 5210 keV level are from 1986Be30, unless otherwise noted.
