

⁴⁵K β⁻ decay 1980Hu10

| Type | Author | History Citation | Literature Cutoff Date |
|-----------------|---------------|---------------------|------------------------|
| Full Evaluation | T. W. Burrows | NDS 109, 171 (2008) | 30-Oct-2007 |

Parent: ⁴⁵K: E=0.0; J^π=3/2⁺; T_{1/2}=17.81 min 6I; Q(β⁻)=4196.5 7; %β⁻ decay=100.0

⁴⁵K-E,J^π,T_{1/2}: From the ⁴⁵K Adopted Levels.

⁴⁵K-Q(β⁻): From the ⁴⁵K Adopted Levels.

Measured γγ(t) and parent T_{1/2} (4πβ,scin). See ⁴⁵Ar β⁻ decay for other details.

† From the Adopted Levels.

‡ From γγ(t).

β⁻ radiations

log ft(α) log f^ut ≥ 8.5.

log ft(E) from the f^ut systematics of 1973Ra10. Δlog f^ut corresponds to the range of f^ut values which includes ≈ 70% of similar known cases.

[†] Uncertain γ 's included in calculation as $(I\gamma + \Delta I\gamma)/2$.

[‡] Only the presence of non-zero feeding of the g.s. could be established, using the technique of [1972Wo12](#). [1980Hu10](#) conservatively estimated $I\beta=5$ +4-2, based on the $f^{1u}t$ systematics of [1973Ra10](#).

[#] Absolute intensity per 100 decays.

[@] Existence of this branch is questionable.

⁴⁵K β⁻ decay **1980Hu10 (continued)**

γ(⁴⁵Ca)

I_γ normalization: 0.0532 I₂₋₂₃ from Σ I_γ(1+α)(to g.s.)=95 2-4. Δ(γ-normalization) includes the 5% systematic uncertainty on I_γ estimated by 1980Hu10 and originally included in their ΔI_γ.

Gammas which were not observed in the coincidence spectra, or at their total energy for high energy gammas, were considered to be direct transitions to the g.s. with the additional assumption of no γ-feeding to the concerned state.

[†] See comment on I_γ normalization. Also see Table IV of 1980Hu10 for % branching ratios.

[‡] From the Adopted Gammas.

[#] 173.26 5 and 2597.8 1, respectively, from 1975TiZY and PRIV.COMM. (L.G. Multhauf and S. Raman) to 1980Hu10. 1980Hu10 obtained a precise value for the 174γ by a separate high-gain run with simultaneous storage of ¹³³Ba and ¹⁵²Eu sources; this measurement was used As a low energy calibration point.

[@] Consistent with results of 1975TiZY and PRIV.COMM. (L.G. Multhauf and S. Raman) to 1980Hu10.

$\gamma(^{45}\text{Ca})$ (continued)

& The coincidence gate included a 511 γ component which was also observed As a coincidence G. The coincident 1706 γ was observed along with the single- and double-escape peaks. Only the single- and double-escape peaks of the coincident 2354 γ were observed and only the double-escape peak of the 2597 γ was observed In this gate. The gate on the 512 γ showed an unexpected enhancement of the 1706 γ . Therefore, 1980Hu10 postulate that the 512 γ was a transition between the 2392- and 1880-keV states.

^a Placed only on basis of energy balance.

^b May correspond to the 1751.1 γ and the 1938.1 γ or 1942 γ In (n, γ), respectively.

^c 147 8 from 1975TiZY and PRIV.COMM. (L.G. Multhauf and S. Raman) to 1980Hu10. 1980Hu10 suggest that their value is correct from the nonobservation of the 1880 γ In (n, γ); however, from the large discrepancy In $E\gamma$ for the ≈ 1.7 -MeV γ between β^- decay and (d,p γ) (1706) and (n, γ) (1710.1 4, the evaluator believes that different states are populated In β^- decay and (d,p γ).

^d See comment on associated level.

^e See comment on adopted G.

^f For absolute intensity per 100 decays, multiply by 0.0527 32.

^g Placement of transition in the level scheme is uncertain.

^x γ ray not placed in level scheme.

⁴⁵K β⁻ decay 1980Hu10

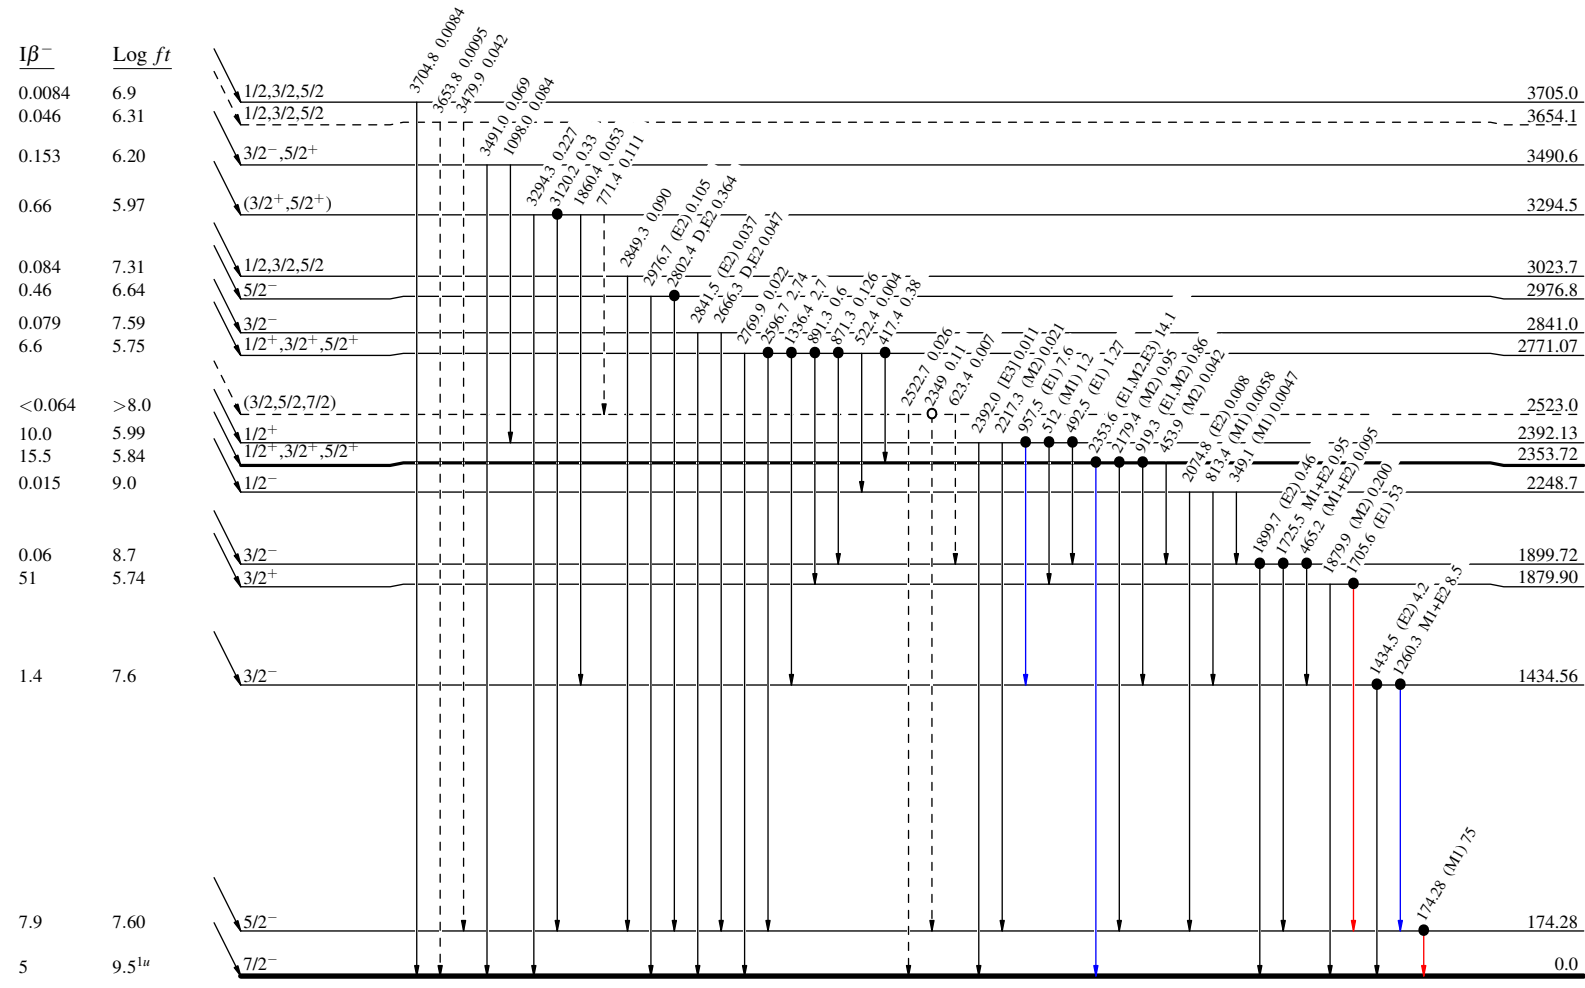

Decay Scheme

Intensities: I_(γ+ce) per 100 parent decays

Legend

- I_γ < 2% × I_γ^{max}
- I_γ < 10% × I_γ^{max}
- I_γ > 10% × I_γ^{max}
