1966Wi11: ET=7.5 MeV; Si.

1967Bj04: ET=13 MeV; ms.

1968Sa09: ET=13 MeV; ms.

1976Do05: ED=52 MeV. Measured $\sigma(\theta=8^\circ-30^\circ)$; Si telescopes. Resolution≈120 keV. DWBA. Also deduced $\Gamma(\downarrow)=\Sigma S(E-E)>/\Sigma S$.1985Ba14: ED=79.2 MeV. Measured $\sigma(\theta)$, A(θ) ($\theta=7^\circ-34^\circ$, 3° steps); QDDM spectrograph, position-sensitive gas proportional counter. Vector polarization≈0.6. Overall energy resolution=55 keV. DWBA.1987Og01: ET=33 MeV. Measured $\sigma(\theta=7.5^\circ$ to 31.25° in 1.5° steps; 32.5° to 125° , 2.5° steps); Si/Si(Li) telescopes. Overall energy resolution=75 keV. DWBA.

Others: see 1995Bu05.

⁴⁷K Levels

$\Sigma C^2S(1d5/2)=64\%$ of the shell-model limit. The 1d5/2 strength is strongly fractionated. See 1985Ba14 and 1987Og01 for discussion.

J(α),S(β) The strength of the g.s. and 3.85-MeV state exhaust 90% of shell-model sum rule (1985Ba14).J(E),S(F) The combined strength of the 359 and 3930 states exceeds the shell-model sum rule for d3/2 (1987Og01,1985Ba14). If the 3930 state were assumed to have a contribution from two-step reaction processes, $C^2S=0.49$ (1987Og01).

E(level) [†]	J ^π [‡]	L [#]	C ² S @	Comments
0 6	1/2 ⁺	0	1.55,1.50	E(level): weighted av of 0 10 (1967Bj04), 0 10, (1968Sa09), 0 20 (1976Do05), and 0 20 (1987Og01). J ^π : from the Adopted Levels.
359 5	3/2 ⁺ &	2	4.16,3.88	T=9/2 E(level): weighted av of 359 7 (1966Wi11), 359 10 (1967Bj04), 359 8 (1968Sa09), 360 20 (1976Do05), and 360 20 (1987Og01).
2.02×10 ³ 2	(7/2 ⁻)& ^a	(3) ^a	0.08,0.22 ^a	
3.35×10 ³ 3	5/2 ⁺ ,3/2 ⁺ ^b	2	0.05 ^c	
3432 19	(5/2) ⁺	2	0.97,0.78	E(level): weighted av of 3420 20 (1976Do05) and 3460 30 (1987Og01).

$^{48}\text{Ca}(\text{d},^3\text{He}),(\text{pol d},^3\text{He}),(\text{t},\alpha)$ **1987Og01,1985Ba14,1976Do05 (continued)**

^{47}K Levels (continued)

E(level) [†]	J [‡]	L [#]	C ² S [@]	Comments
8035 38	(5/2) ⁺	2	0.33,0.39	E(level): weighted av of 8020 20 (1976Do05) and 8130 50 (1987Og01).
8530? 20	5/2 ^{+,3/2^b}	2	0.14 ^c	E(level),L,C ² S: from 1976Do05 . Not reported by the others.

[†] From [1987Og01](#), except as noted. States at 4.17, 4.36, 4.74, 4.90, 5.79, 6.26, 6.42, 7.15, and 7.38 MeV were not reported previously.

[‡] From comparison to A(θ) for the 3.93- and 5.46-MeV states, except as noted.

[#] From [1985Ba14](#), except as noted.

[@] First value from [1985Ba14](#) (normalization=2.95) and second from [1987Og01](#), except As noted. [2001Kr01](#) compared and reanalyzed the spectroscopic factors of [1985Ba14](#); see $^{48}\text{Ca}(\text{e},\text{e}'\text{p})$ E=440 MeV for discussion.

[&] From $\sigma(\theta)$ and A(θ).

^a Either 7/2⁻ or 5/2⁺; a pure L=3 transfer does not reproduce $\sigma(\theta)$ ([1987Og01](#)). See discussions in [1987Og01](#) and [1985Ba14](#).

^b From angular momentum transfer.

^c If J^π=5/2⁺.

^d Unresolved by [1976Do05](#).

^e Believed to be populated primarily through a two-step reaction ([1985Ba14](#)). [1987Og01](#) could not obtain a fit to $\sigma(\theta)$ either by direct or two-step reaction calculations.
