$\gamma(^{47}\text{V})$

Angular distributions (AD) and directional correlations of oriented nuclei (DCO) measured At 37° and 79°. An AD of ≈0.8 suggests J→J-1 dipole and of ≈1.5 suggests J→J dipole or J→J-2 quadrupole transition. The DCO ratio has values for stretched dipole and quadrupole γ_2 transitions of ≈1 and ≈1.5 for dipole γ_1 and ≈0.5 and ≈1 for quadrupole γ_1 ; same ambiguity for J→J dipole and J→J-2 quadrupole transitions As In AD.
