

$^{46}\text{Ti}(\text{p},\text{p}),(\text{p},\text{p}'):\text{res}$

Type	Author	Citation	Literature Cutoff Date
Full Evaluation	S. Ota and E. A. McCutchan	NDS 203,1 (2025)	1-Apr-2025

1961Du03: E(p)=800-1400 keV. Measured excitation functions using magnetic analyzer and NaI detector. Observed 30 resonances with an average level spacing of \approx 13 keV and notes that the natural half-widths of all resonances observed was less than 0.5 keV.

1969Ky01: E=2.5-2.9 MeV; overall energy resolution \approx 1700 eV. Measured $\gamma(\theta)(889\gamma)$ and γ -ray excitation function for the first-excited, 2^+ , state; NaI. Observed 45 resonances; deduced J^π and resonance parameters.

1971Ka23: E=1350-2280 keV. Measured excitation functions; NaI. Observed 126 resonances in the excitation energy range of 6.5 to 7.4 MeV with an average level spacing of \approx 6 keV. Compared to resonances in $^{48}\text{Ti}(\text{p},\gamma)$. Identified eight prominent resonances as isobaric analogs of states in ^{47}Ti .

1973Pr02: E=1.5-3.1 MeV; overall resolution \approx 300 eV. Measured $\sigma(\theta)$ at four angles. Observed 144 resonances; deduced J^π , resonance parameters, and exit-channel L.

1979Ch20: E=2.25-3.10 MeV; overall resolution =350 eV. Measured $\sigma(\theta)$, $\gamma(\theta)$; surface barrier, NaI. Studied ($\text{p},\text{p}'\gamma$) to the first-excited, 2^+ , state for 47 L=1 and five L=3 resonances between 2.25 and 3.10 MeV. Deduced J^π and resonance parameters.

See **1977Ha45** for a compilation and comparison of the resonances observed by **1973Pr02**, **1971Ka23**, **1969Ky01**, and **1961Du03**.

See also $^{46}\text{Ti}(\text{p},\gamma)$ E=0.72-4 MeV and E=0.4-1.8 MeV.
